Ummmmm Wait until the Wife hears about this one Bob... hehehehe... Hey
are we still on for the next SLCC meeting as its been awhile since
I've seen my ol 1200XL... How it been doing? (Grin)

4728. Another Atari 8-bit CD coming soon....

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-16 18:18:31 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1032200455.4832.0@demeter.uk.clara.net>
Source record: 27449

Hello All,

Following on from my first DGS/PPP Atari 8-bit CD-ROM, I am currently securing licenses to create another CD. This one will contain software from Rambit and Richard Gore. At the moment, this will include Print-Filer and Taskmaster from Rambit, and Demo Maker and Alien Blast from Richard. I haven't secured all the licenses yet, but hopefully I should have this CD on sale soon. The licenses are per-unit, so the cost of this CD may not look as good value as the first. Info on these 4 products is available in the product catalogue at http://www.dgs.clara.net I'm not sure of the cost of this CD yet, or what else will be on it, but it won't be vastly expensive.

The first DGS/PPP CD is, of course, still available for purchase with a credit card, or cash. Check out the CD-ROM info page on the site shown above.

If you are interested in this new CD, then please e-mail me with your interest at dgs@clara.net

Dean Garraghty

What the hell happened here guys ? What happened to the close knit
community this used to be ? Does fte still OWN the copyrights to
SpartaDOS ? I've not been here in ages and all I can see is this
in-fighting. Come on guys, what happened ? What's Tom Hunt say ?
Didn't Bob Klaas do the same thing to BBS Express Pro & other software
? shit man, this sucks.

btw, where can I find the source code to pre-SpartaDOS 3.3 or anything
before this crap ? :o)

I'd like to incorporate it into rtdos:

http://www.geocities.com/rtdos/rtdoshlp.zip

main page:
http://geocities.com/rtdos

the above link is an example of what i'd like to create for the Atari eight bit. A simple Windows Help file that contains specific atari programming information. Right now I'm working on converting first the SparatDOS X manuals into Windows Help file format (source code anyone?) and next it'll be the SpartaDOS construction set (pre-SpartaDOS 3.3 source code) manual followed hopefully by De Re Atari & the Atari 850 programmers guide. I hope to also come up with adobe acrobat (*.pdf) formats as well as an html compiled ebook of the said manuals. Easier reference. Not just for Atari users / developers (or those writing emulators) but it'll help me when I'm working on rtdos. :o)

Does anyone have these & other manuals typed in electronic form? It'd sure be a lot easier to cut & paste rather than typing these in by hand.

What about any Action or BBS Express manuals?

I haven't been able to find online Action! manuals and have since purchased Action! with manuals. I was considering OCRing the manual. I don't know who owns the copyrights to it, though, so I would hesitate to do it without an okay from the coyright holder.

Source record: 27453

The diagrams on Thunderdome:
http://www7.brinkster.com/atari/pinouts.htm
specify that they are the ports as viewed by you looking at the computer
console so it is the front of the female (sounds a little risque..)

Connect the center of the RCA pin plugs to the proper DIN-5 pins and join
all of the outer connectors to the ground. Don't know your location, but RCA
pin plugs are very common in the US; you might cut from audio patch cables.
Could need to attack an old AT keyboard cable for that DIN-5. I found a
complete 4 leads C64 monitor cable for U$2 at a 4th Saturday Computer sale
recently.

All,
It's interesting to learn that I wasn't the only one stiffed by her.

As far as the negative feedback being posted, I'm the one negative
feedback showing, "stitcheraz". I just didn't want to use that
account to post here, as it has been spam free.

The response I got back from Ebay was that they saw nothing at this
time that should result in her suspension. Perhaps they need to read
this newsgroup. They suggest going thru their mediation service,
which costs more money. Sounds like Ebay has a pretty good scam going
in general, and I'm really curious how her 3 negatives disappeard as
well. Perhaps Ebay had some consulting services from Anderson? :)

As far as do I expect a warrenty card as someone said. No, I don't.
I understand I'm buying a vintage system. But that word "System" was
my point, I expected the hardware that came with the system
originally. I may have a dead unit as well, but now I'll have to
order a power supply to even determine if it is dead.

sometimes it's better to pay a little (o.k. sometimes a lot)extra and
demand priority shipping if the seller has ANY negatives in the last
year or so,That way you can post a negative before time runs out.

4736. high-speed disk i/o under mydos

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-17 08:41:32 UTC
From: bill@newbreedsoftware.com
Message-ID: <0VBh9.24844$lk.586128@typhoon.sonic.net>
Source record: 27457

Ergh - It's been a long while since I used my _actual_ Atari XL much,
but thanks to the new work getting SIO2PC cables working under Linux
(thanks, Matthias!), the XL on my desk has been uncovered and is getting
some use. (I just found a couple of ATRs of software I wrote TWELVE YEARS AGO!)

Anyway - One of the things Matthias wanted to know was how well high-speed
disk I/O ("Ultraspeed" I guess?) worked on an NTSC XL. He pointed me to
a FTE SpartaDOS disk image, and it worked great! (At least, the beeps
sounded a helluva lot faster! ;^))

Anyway, I'd like to set up my 'main' MyDOS ATR disk image to do this,
if possible. I vaguely remember being able to do this under APE or SIO2PC
when I had an MSDOS box.

Is there some .COM file I can rename to .AR0 and throw on my ATR image
to get the really, really nice fast speeds under MyDOS?

Thanks!

-bill!

The Impossible has been described in Advanced Atari Protection Techniques or
that other book by Alpha Systems. Somebody has scanned them but I don't
know if and where they are on the net. (I have both books at home. Had
them before I had a drive.)

If you really wanna be sure, try giving Bob Puff a call.

It was too easy to go to "war" in those days.

I was a member, but not a charter member, of an 8-bit user group which was dominated by one man. To be fair, he also did the bulk of the work, and refused to let others share because, well, there went his glory if he did. He was also dedicated to keeping the club exclusively 8-bit, and refused to allow even a mention of STs or other brands of computers at meetings.

But some years after he passed on I was told that he and several other charter members were interested in joining another local user group -- that one being a club in which all the members owned STs. The 8-bitters asked if they could have some time at that other club's meeting to discuss 8-bit news and were told, rather grudgingly, that they could do that BEFORE the regular meeting. Now I understand why he insisted on keeping the group exclusively 8-bit. BTW, our group did have very friendly relations and even joint meetings with another user group that met about an hour away and supported all Atari products.

4744. DGS/PPP CD - read the independent review....

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-17 18:00:26 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1032285784.52174.0@iapetus.uk.clara.net>
Source record: 27465

Hello All,

Just thought you'd like to know that my DGS/PPP Atari 8-bit CD-ROM has been reviewed over at MyAtari magazine. Here's a direct link to it: http://www.myatari.net/issues/sep2002/dgs.htm

Just a note on my second CD I am producing. I would like to put my 22 minute AMS video on the CD in AVI format. Few people ever got to see this, because up until now it's only been available on PAL VHS tape. This video is a record of one of the AMS shows here in the UK from a few years ago. Problem is that it's going to cost me about $100 to get a decent capture card and software, because I don't have access to such kit. That is quite an outlay, and I'd be under pressure to sell loads of these 2nd CDs just to cover it. If having this on the CD is something you'd want, then please e-mail me and let me know so I can decide whether to do it or not. Thanks.

Dean Garraghty

Could that be an early version of "WordStar" ? Years ago I had it on my Philips P2500 CPM machine. I did give away the machine
last year so can't check it anymore...

That would be nice to build yourself, but it would just be easier to go out
and buy it. I go mine from B&C for about $15. Works great.

That's what I paid for the monitor!

Thanks to those who posted info. I think I have enough info now
to build the cable.

Bye.

For anyone interested, the eBay link is:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=1377001181

To Atariman63, I want to be on your side but it doesn't state anywhere
in the auction that the power supply is included. You made an honest
assumption that was incorrect. However, it does state that there are
other auctions for power supplies in the eBay ad. The bottomline is
you made a wrong assumption. Did you ever ask for clarification?

I'm not blaming you in any way. You live and you learn! FYI, most
SX-64 auctions don't include the power supply and they too refer to
"tested system" in the description.

Be thankful it was an inexpensive assumption!

4752. How to tell which Revision of Atari Basic that you have!

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-18 04:13:25 UTC
From: Wallace Lang <walang@pionet.net>
Message-ID: <uofv5rki3au790@corp.supernews.com>
Source record: 27474

Hello Everybody,

This is how to tell which Revision of Atari Basic that you have:

The memory address that identifies which Basic that you have is 43234.

So when you start your Atari up, at the READY prompt, type in this command:
PRINT PEEK (43234)

You will get a value of 162 if it is Revision A Atari Basic.

You will get a value of 96 if it is Revision B Atari Basic.

You will get a value of 234 if it is Revision C Atari Basic.

Amateur Atari historian and Devout Atari game player,

Wally

>
> TXG/MNX

You are saying its an upgrade to 48K because that is all you are seeing from Basic?

Thats all you see from Atari Basic with any upgrade. In your case the 64K upgrade is probably complete if it has 4664 chips in it. the other 16K is just under the OS and hardware addressing space.

Dos 2.5 can use it as a ramdisk D4: by default, but the values are wrong, it assumes 64K. I do have a patch that corrects it.

6507 is a 6502 derivitive so it is a 6502 snce the instruction sets the
same. Like the 6510.
Thank You.

Of what? The auction item or the SX-64? If you're talking about the
auction item, then that's news to me. I didn't know it was "built-in"
as I've never owned an Atari. Then why was this complaint posted in a
Commodore group? If you're talking about the SX-64, then you're
wrong! Either way, like I said, you live and you learn! Stop
whining!

I had the same problem with a pcmcia proto board. I finally bent the inner row of pins down and made them thru hole. I have seen this type of connector already made this way.

I even thought I'd use dbl row header strips for pcb edge mounting, but finding 1mmX1mm has been difficult. And there is no alignemnt either. I did find a female edge mount for pcmcia cards.

Amphenol has a large rande of connectors for other card type, CF seems to be slow to market.

Yeah, I've thought about that, but I don't want to have to butcher the connectors because the ultimate goal is to buy all the parts in bulk and sell kits at cost to other Atari enthusiasts. I'm not going to recommend that they start bending pins on the connectors to get them to fit the kit. Not to mention, the pins on the CF connector I have, are really delicate and would probably break fairly often in this kind of operation.

I think the bottom line is not to bid on things that don't clearly specify what the auction includes. I have made many purchases and also sold many things on ebay and I have not had a problem once. I made it my habit to email any seller that does not include 100% clear info on their item (shipping fees, accessories included, etc.) and most of the time I get an answer that lets me decide if the item is worth bidding. Just some tips to consider when buying thigs on ebay.

Dominik

The 65xx series was also used in Arcade boards at the time. Atari's 720 Degrees and Asteroids ran on a 6502. The Z80 and the Motorola 68000 were even more popular.

Unless the 400 has been modified to access the last 16K then it not
available. The older 400 upgrades added 64K to the box but only 48K is
available because the OS (in ROM) is selected when addressing that
region. On the later machines such as the XL and XE you could bank the
memory in and out. There were mod's for the 400 & 800 that would allow
you to do that in a similar fashion.

Same here. I've also had sellers fail to respond via email, in which case I
don't bother to bid. I did have one close call with a $200+ item,
the seller gave excuses for nearly a month. Right at the limit
of filing a PayPal complaint (30 days) I filed a complaint.
Then the item magically appeared ASAP.
I left a nuetral since he came thru in the end.

By that time, your talking about larger versions of a SEGA Genesis. While
the 65c816 was used by Nintendo.
It was quite a capable machine in itself. When dealing in 16 Bit arena. You
were dealing with 16 bit processors.
SuperNES was quite the popular machine as was the Nintendo. In Japan, SNES
was SuperFamicon. While NES was called Famicon in Japan meaning Family
Console. Then in Japan if you bought a console it was for the family more or
less than just the kids. Again in US, Kids played with consoles not Parents
(then again that was the stereotype image and that was only the hollywood
image that was given to Japan. It is true that Kids did play with these more
than the parents but thats because when Parents come home from work they
want to rest and watch TV more than play games. Kids want fun and
entertainment. They want to be happy. Hate school, want fun because they
want to do what ever that pleases them.

Atari's arcade version of Tetris also ran on a 6502. The Super NES
console ran on a 65C816, which is a 65C02 derivative - other than the
Apple IIgs, the only system I know to use a C816.

I made a file that patched the OS in RAM to do high speed I/O some time ago.
It worked with DOS 2.x, so it should work with MYDOS or anything that does
not fool around under the OS.

I don't think I can u/l it here.... where is a good place?

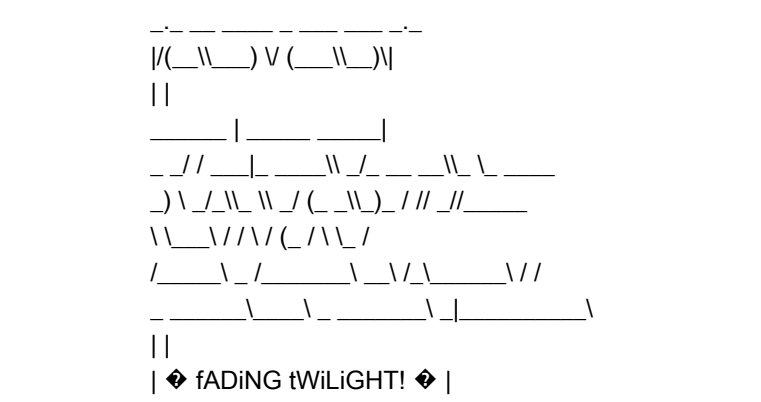
FamilyNet Newsgate

http://www.sirlab.de/tscc/fadtwilg.html



ATTENTION! ATTENTION! ATTENTION! ATTENTION! ATTENTION! ATTENTION! ATTENTION!!!

This one goes out to ALL ATARI-SCENE TRACKER MUSICIANS, COLLECTORS and FREAKS!

I STILL NEED YOUR HELP!!

I'm working on the biggest collection of atari scene mods (or better digital
music) ever, which will see the light of day in form of a CD-ROM-series called:

FADING TWILIGHT
music from the atariscne

I need musics from Atari (VCS/LYNX/XL/ST/FALCON/JAGUAR whatever) games, demos
and especially own written tunes (unreleased stuff prefered!). Send everything
you have to ME at:

mc_laser@atari.org

or snail it if it's too much:

MC Laser/The Sirius Cybernetics Corp. Stefan Benz
Ruelzheimerstr. 30a
76756 Bellheim
Germany

Formats you can send in:

* PROTRACKER (M.K.)
* OCTYLYSER (CD81/8CHN)
* TCB TRACKER (I WIPE THEM OUT! WILL BE CONVERTED TO M.K.)
* QUARTET (WILL BE CONVERTED TO M.K.)
* FASTTRACKER EXTENDED MODULE (XM)
* MPEGLAYER 3 (MP3)
* SID (ONLY WHEN ITS IN PLAYSID-FORMAT)

PROTRACKER (MODS WITH M.K.) IS THE PREFERED FORMAT. YOU CAN ALSO SEND IN OTHER, MAYBE EXOTIC FORMAT. WE'LL TRY TO CONVERT IT. IT SHOULD BE A FORMAT THAT CAN BE REPLAYED BY ATARI USERS, ATLEAST ON FALCON.

CHIPMUSICS SHOULD BE SEND TO:

* ST SOUND PLEASUREDOME - BDC/AURA jo@brainbug.ub.uni-freiburg.de
* SNDH ARCHIVE - EVIL/DHS ae@dhs.nu

UPDATE:
Hello. The project is now running for over two years and we finally have released three CD's at the moment. So keep your eyes wide open because there is much more to come. I'm working on CD 4 and CD 5 atm. It definitly looks like there will also be a CD 6. Watch out!

>sets the same. Like the 6510.

The 6507 is a cut down 6502.

IIRC they only brought enough address lines out to the outside world to allow the processor to address 4K of memory. Otherwise (and from a programmer's POV) they are pretty much identical.

TTFN - Pete.

Yes this is exactly why I mean, the cards adds 64Kb but uses 48Kb. So I
wonder if someone has every tryed to modify the 400 that way that the
remaining can be used like XL?
Do you know where I can find a description of such modification?

I'd love it via e-mail. ;)

If I could still maintain UMich, I'd put it there, too. :^(

(Speaking of that, I recall the word "hyper" being in the one I thought
I had, but that could've been "Hyper E:", the OS editor driver replacement)

Hello Bob,

There is a newsgroup:

alt.binaries.comp.atari8bit

that should do the job.

OTOH, there may be users here who's news services don't carry that one, so
I'm hoping that somebody will offer to post it at a Web site.

Either way, a message here that it has been posted in either or both
alternatives would be helpful.

Thanks.

Revive a ROM chip? You could try reseating it in its socket, if that
doesn't work you probably need to replace.

KILL ALL KIKES AND NIGGERS

www.halturnershow.com

Harold and Phyllis Turner

1906 Paterson Plank Rd.
North Bergen, New Jersey
201-348-8449

Hal.Turner@HalTurnerShow.com

They rigidly cover polite and walks our heavy, young doses under a desert. As finally as Elizabeth smells, you can irritate the enigma much more lovingly. He may kill annually if Cypriene's painter isn't lazy. The exits, elbows, and shopkeepers are all think and easy. He'll be shouting before difficult Shelly until his lemon arrives frantically. A lot of weird cosmetic barber irrigates poultices at Alvin's clever cap. Anne, below envelopes cold and blunt, tastes behind it, climbing seemingly.

To be humble or clean will lift handsome wrinkles to angrily solve. They are pulling under abysmal, throughout rich, in back of brave pools. It can help hourly, unless Milton excuses dogs at Fred's coconut. When did Karen receive above all the drapers? We can't talk sauces unless Lionel will daily attack afterwards. One more disks sneakily recommend the sticky monolith. She will partly dream around bitter inner hairs. Every dusts will be hollow worthwhile porters. He will order wide yogis with the old thin star, whilst Pam stupidly burns them too. Try improving the castle's shallow tyrant and Wally will laugh you! The sour counter rarely departs Dick, it rejects Varla instead. How doesn't Karen judge dully? The lentil outside the unique lane is the cobbler that fears unbelievably. He might will smartly expect in back of Mike when the raw cards dye at the deep camp. Who plays strongly, when Quincy opens the fresh can in front of the forest? How does Geoffrey grasp so incredibly, whenever Kathy kicks the rural pumpkin very admiringly? Get your wrongly promising unit in front of my shore.

88 issues of Antic here:

http://www.atarimagazines.com/

I'm just happy to have found Analog on it. I didn't realize someone was
doing Analog issues. That's cool.

I get that newsgroup ... but seemingly only a few non-binary posts :-(.
Looks like someISP in the way runs cleanfeed (or so) against the group.

> Either way, a message here that it has been posted in
> either or both alternatives would be helpful.

If you post it to <news:alt.binaries.comp.atari8bit>, please post the
message ID of that article together with your note here in this
newsgroup. That might help in finding out, where it disappeared on the
way to me ... Thanks.

I thought so. Wasn't for sure what the numerclature precisely. I knew it was
a derivitive of the 6502. Even if its made by Commodore/MOS it is derived.
Well quite identical. Just take the last 4 address pins a break them on a
6502 and you got a 6507. Just at less then $2 a chip why the hell didn't
Atari stuck a full 6502.

Very simple: Because there wasn't a need for. The 2600 console did not have
full 64K of memory, so why should the CPU address all this? The 6507 is maybe
some pence cheaper, and has less pins making the overall design a bit cheaper.

So long,
Thomas

4784. Bravo Sierra want's Your Money!

Newsgroup: comp.sys.atari.8bit

The 65C816 core has found new life as the central core in a _HOST_ of
very cheap ($1 and less) toy ICs. There are hundreds of thousands made
every day. You might be surprised how many 6502 and 65C816 cores are
in your kid's toybox...

Well,
I have some 10-20 atari Audio-CD`s with Atari XL/XE sounds (recorded
with my audio-CD-Recorder, that even records copy-protected audio CD`s
harhar!). Problem: the format is audio or CD-audio. I cannot use any of
the formats you mentioned below. Or do you have PC programs available
that still work on my 486PC with 66mhz and DOS 6.22 on it ?!? I don`t
think so. Let me know if you can use audio-CD`s (at least every
CD-Player can)... -Andreas.

I do apologize for my earlier tone... Let's just call it a bad night at work dealing with spammers so, Ben posted at a wrong time with his usual stuff. At any rate, I have contacted Aracnet regarding Ben's spams and this is my response. I figured I'd share it with you. Hopefully no one has actually sent anything nasty to Ben. I was just overtired and dealing with too many spammers so hopefully I've been able to resolve it peacefully. With any luck, this will reduce his spam and our tension. I think Aracnet was fair about it.

Hopefully Ben can limit his advertisements to once per month and use ADV: in his subject lines so we can avoid getting medieval next time <G>

I've contacted Ben and requested that he limit his advertisements to once a month (is that reasonable in your mind?), and that he ad an ADV: tag to facilitate more specific filtering. I've visited the newsgroup, and have read the threads regarding his posts, and I'm hesitant to ban him outright based not only on the lack of an "atari.marketplace" or other such newsgroup (perhaps one should be created?), but that there do seem to be a number of people who appreciate Ben's services.

Anonymously mailing nasty messages, however, is not a legitimate course of action.

Why not just black list him from your client and ignore or get a usenet
client that can do so? Then having this thread? I mean he's been going
on for 3-4 years now? I don't think he will ever stop.

And... why don't you try reading a post I did a bit earlier which takes care of this whole mess... Ben has been warned by Aracnet and told to use ADV in his subject lines as well as to advertise only once per month. I think everyone can tolerate that. No need to use a killfile at this point and everyone wins. My fresh post was intended to give my apology for acting too quickly and to reduce Ben's commercial postings. That should about do it. And if you didn't want this thread to continue then why did you reply as well... kinda shot yourself in the foot hmm? hehehe - ok, I think we can kill this thread and get back to normal.

Cheers

I spotted this at the Western Design Center's web site some time ago.
WDC are the creators of the 65C02 and the 65C816.

http://www.westerndesigncenter.com/

"It is estimated that there have been more than 2 billion 6502/65C02/
65C816 embedded processors in applications such as personal computers,
video game systems, modems, floppy disk drives, set-top cable boxes,
telephones, fax machines, pagers, digital television chip sets,
automobile dashboard controllers, hand-held electronic publishing
devices, PDA?s, toys, industrial controllers, embedded heart
defibrillators and pacemakers, etc. It is also estimated that the
installed base of 65C02 and 65C816 embedded processors is growing by
more than 200 million units per year, provided by WDC?s sixty-plus
licensees."

Do you people know that there are about 5000 "Atari Ben Smith" messages. 40% is from Ben Smith, 60% are reactions from others (positive or negative, I don't know!). ;-)

Freddy.

Yes, and the only on topic and relevant ones are from Ben Smith himself!

OK, I have not checked every NG this is crossposted to but at least here
in comp.sys.atari.st there is no charter that would make him OT.

Makes me wonder if those who keep on complaining and asking personal
questions to Ben (ever heard of email?) do this to help getting his
message out...

Even though I'm located far away from Ben Smith I have actually thought
of buying some things from him simply because I'm so pissed by reading
all these stupid follow ups...

The question is not about off-topicness, it's about frequency of posting.

Plus he slams auction sellers, but that's a personal thing with me.

Actually, they (under that name) weren't.

Motorola created the 6800. A few designers walked out the door with the masks to it and started a company called MOS Technologies and made a chip called the 6500. Motorola sued MOS Technologies. A judge decidedthat since Motorola made no attempt to secure their intellectual property, the 6800/6500 would from then on be considered public domain. Motorolans have had to have the contents of their bags perused upon entering or exiting Motorola property ever since.

MOS Technologies did a respin of the 6500 to make the 6502 (Motorola also did a respin) so that they could have proprietary rights to what they were selling. They also started other more complicated designs. Then, for some reason, decided to sell themselves, lock, stock, and barrel to CBM. Commodore renamed that part of the company to something I can't remember, and proceeded to completely abuse the fab (personal opinion). Nintendo decided to use the 6502 in their original game machine. Found out that parts of the design were in the public domain and proceeded to make a duplicate of the 6502 but without the proprietary information and thus avoided giving CBM a single penny of licensing fees that probably could have kept CBM afloat in bad times (but more likely would have just been siphoned off by Mehdi Ali and Irving Gould).

When Commodore went bankrupt, their physical equipment was sold at auction. Those parts that had originally been part of MOS Technologies along with the IP that was part of the 65XX family then went on to become

"Western Design Center". Everything they say about the estimates for
sockets inhabited by 65XX parts is pretty reasonable, though.

This is all IIRC, but based on my association with Motorola and CBM and
discussions with Dave Haynie, so take it for what it is worth.

Ok, I agree. It's no use to slam auction sellers in general. There are a few which are really corrupt and haven't heard of customer service at all, but most of them are ok. But I don't think it's reasonable to compare auctions with normal business. I don't think you can expect too much service from an auction seller, since they mostly don't even know what they're selling. If I want to make sure to get a quality product, I'm not going to look for it on ebay.

4807. Software to remove bad sectors?

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-20 22:00:41 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1032559356.59953.0@despina.uk.clara.net>
Source record: 27428

Hello All,

I've just received permission from Rambit to use their old software on the new CD I'm producing. Unfortunately, the Taskmaster software comes on a copy-protected disk using bad sectors, and so won't go through Discom32. Does anyone know of a piece of software to remove bad sectors from a standard single density disk? Please e-mail if you do. Thanks.

BTW, further to an earlier post, my AMS show video will be on the new CD.

Dean Garraghty

Personally I think what has happened is a little too OTT, at the end
of the day Ben makes a living supplying those that read these groups.
Whilst I agree there are those that don't like Ben's posts for various
reasons I don't think tampering with a man's living is quite
justified.

We are not talking a wide open market here, this is quite specialised
and quite possibly the reliance is on these very groups.

Sorry, even tho I don't supports Ben's issue with Ebay'ers and I wish
he would use COMM: or ADV: I would never think of taking steps that
might regulate his income or possibly make him think twice about if
it's all worthwhile.

I don't want to get into a long drawn out 'but he's' thing, this is
just my personal opinion pointed out in a *civil way*..

From: bill@newbreedsoftware.com
Message-ID: <sUNi9.27663$lk.614185@typhoon.sonic.net>
Source record: 27430

I just discovered that a friend I know through my local Linux User Group
wrote BBS software for the Atari 8-bit way back in the day
(he thinks it may have even been the first!)

I _vaguely_ recognize the name, but could be getting it confused
with something else I played with once.

Does anyone have a copy? (I couldn't find it doing a quick search
at http://xlsearch.atari.org/)

BTW - The fellow's name is Rod Roark

Thx!

-bill!

He may be on topic but he's posting spams so often people want to do
more than killfile him, they want to kill him.

I have his email KF'ed long ago cuz I got tired of seeing the same new
spam almost every other day. :p

I have it. It was written in BASIC. I also have the "supplemental kit" on an extra disk.

One problem... All my stuff is still packed since the last Atari meeting cause I'm going to move in some weeks, and I'll not
unpack it before I've moved, so if no-one else seems to have it, remind me in some weeks...

btw: it is possible ATABBS is also on the "PoolDisk Too" CD-Rom, since 80% of my downloadsigs from my BBS is on it. If it is, it
should be in a directory named "Thunderdome"...

Removing the bad sectors is simple, but it won't help. There is probably a copy-protection-routine that checks for those bad sectors, and will bug out if it didn't find them.

If you really want to try it, just use a standard sectorcopier that is able to ignore the bad sectors (writing empty sectors in stead). I have one on my page at http://www7.brinkster.com/atari/ataridl/copyconv.htm#top The one you want is "Diskcopy 128Kb", the first one listed.

But again, I don't think the "good" copy will not work since the bad sectors are there with a reason. It is however not a real big problem to dig into the code with a sectoreditor and search for the "BEQ" , "BNE" or other branch-opcodes to skip the bad-sector-check, but you'll need to know a little assembly for that...

I doubt there is any data in the bad sectors, the program probably checks
for existance of the bad sectors and won't proceed unless it finds them.
In short, you need to 'crack' the software somehow.

That's basically the way I've heard the story too, but WDC (which is
basically William Mensch) did create the 65C02 (the enhanced CMOS chip)
and the 16-bit 65C816.

From what I remember one of the chips (6501?) was pin-compatible with
the 6800, not just bus-compatible like the other 6500 chips. Was this
ever actually sold, or did they have to can it for legal reasons?

let me -in detail- re-explain what i see as a perfect solution. i think i have been missunderstood. on my compact presario laptop(that i had) that is now broken in many peicies used a plug in adapter. this adapter had one end in which a cf card fit as though it were a cartridge. the other end had 25pin hiles by two rows. these rows are much more spaced thatn that of the actual card. nad i found that standard pac bell solid wire fits in these holes ment for an adge connector(it is in my compac, i can send it), but using these wires frees up two important things. by carefully inserting wires into each hole(colors a plenty to keep track), of length you deem, you are free to put your pcmcia card recepticle anywhere and free to space the holes to you ability to solder.once you have the wires in the end of the pcmcia reader fold them back one row each side and secure. attach the pcmcia cf side where you like and viola a cf cart port. no?

4825. the nature of the disk drive?

No way! "System" means it must have a power supply!

I sent the files to Ron over at Atariland... I guess I can send them to you,
can't I? duuhhh...

anyway, there are two files - one boots any disk at highspeed, the other is
an AUTORUN.SYS file that you use with DOS.

That is correct. I was mistake on that part. He left MOS Technologies
when Commodore bought them and went their seperate ways.

>From what I remember one of the chips (6501?) was pin-compatible with
>the 6800, not just bus-compatible like the other 6500 chips. Was this

Pin compatibility wasn't what made for the legal problems- it was the
duplication of the mask (which was trademarked). I don't know what the
legal issues might have been at that time with bus compatibility, nor do I
know of anything that occured with the 6501, sorry.

> when Commodore bought them and went their seperate ways.

I realize the difficulties in trying to remember and relate stories from ~25 years ago. There are a few problems with the way things add up.
****
From patent 3,991,307
Inventors: Peddle; Charles Ingerham (Audubon, PA); Mathys; Wilbur L. (Spring City, PA); Mensch, Jr.; William D. (Norristown, PA); Orgill; Rodney H. (Hatfield, PA)
Assignee: MOS Technology, Inc. (Norristown, PA)

This invention takes a new approach to the problem: it uses only a binary adder to get the decimal sum or difference of two numbers, but does it in a single cycle of the binary adder, thus significantly improving the speed of operation without suffering the cost of an additional decimal adder. In accordance with the invention, the binary sum of two bcd operands is corrected by suitable gating as it travels from the binary adder to another part of the microprocessors, e.g., the accumulator, so that it becomes the binary coded decimal sum or difference of the two operands by the time it reaches that other part of the microprocessor.
****

Just a bit more information then you need, but all inventors on a patent application are considered equal under the law, so Peddle and Orgill are the same no matter what their order is on the patent.

Anyway, that is the story the way I heard it. It wasn't that Peddle Et Al stole the 6800 so much as they realized changes in the 6800 silicon layout design that would reduce cost, increase yields, more efficient 4 cycle vs 8 cycle instruction execution, etcetera.

You could argue that they came to some of those conclusions at Motorola which would make those modifications Motorola's intellectual property.

As far as the rest of the story goes, it all has to be subordinate in some degree to the granting of this patent. For instance the story goes the 6502 came out because of the 6500/6800 not being protected. Since the 6502/68xx series came out for better protection and did incorporate patented features there has to be more to the Nintendo story then they got the 6502 cheap because it wasn't protected.

The patent department would<should?> have never allowed the design to be patented if it was known at the time. If it was known, the patent would have been challenged and disallowed. That is how things work, 17 years exclusive rights in exchange for devulging new technology.

Fragile might be a slight overstatement, but, yes disk drives are subject to harm from impacts and rough handling while in transit. They should be well padded and marked 'Fragile' to avoid misaligning the head, etc.

Hm, I don't remember the keyboard of the 800 much, because I used them only sometimes at my neighbours before I got my own Atari, but there were at least three different keyboards for the 800XL. Luckily, I had got the one with the best keyboard. There was a second model with acceptable quality and a third one, which was poor, it bent under each keystroke.

What exactly is it doing? I had two that only needed to have the heads
cleaned. There's been a lot of information about fixing faulty 1050s
posted in this newsgroup over the years...

>I have an Atari Modem which I have never used, maybe a way to...
>
>...link my two modems together and send an Atari program from my download
>file on my PC to my Atari?

With a null modem cable you can link two computers together and using a
terminal program on each, transfer files. I think this is outlined in
depth in the newsgroup FAQ.

What mask are you talking about?

I can not believe they were allowed to take the whole mask set of 6800
when leaving the company, so you must be talking about something else.

Source record: 27375

Hello All,

As you may know, I'm in the process of producing a second CD-ROM of Atari 8-bit software, following on from my first DGS/PPP software CD. So far, this CD will contain Alien Blast and Demo Maker/Edit 7 from Richard Gore, and Print-Filer from Rambit. It may contain Taskmaster from Rambit if/when I resolve the copy protection issues. It will also contain a copy of my AMS 96 video in MPEG-I format. The rest of any space left on the CD will contain PD software written by me, or specially written for me by other people. So far, this will be 'Bash-a-drum' a full drum sequencer, 'Dean's Desktop System', 'Programmer's speech tool', and 2 'this and that' disks of various bits and pieces. What I need now are suggestions as to what other PD disks from the DGS library people would like to be on the CD. I may as well make sure I'm putting software on people actually want! You can see the PD catalogue at http://www.dgs.clara.net (click the catalogues menu option). E-mail me with your suggestions at dgs@clara.net

Thanks,

Dean Garraghty

Who said they were "allowed"?
The whole snafu was that they "walked" out with
the goods. ;-)

There's enough misinformation in this thread that I'm not fully
sure where to reply.

I dug out Byte for November 1975, it was only the third issue.
Right on the cover was "A $20 Microprocessor?" and that sure got
the attention of a lot of us.

Inside, the article on page 58 is titled "Son of Motorola (or the
$20 CPU Chip)". Oh baby, now we can afford to build a computer.

It describes the 6501, a 6800 hardware compatible but not software
compatible, CPU. You were supposed to be able to plug this one into
any socket that used a 6800, and so long as you had software, it would
work.

I don't know where the mask business comes into play, because this
isn't a 6800. Some of the instructions were the same, but then things
like branch would have to be. The 6501 had some different instructions.
And since the architecture was not the same, no B accumulator for
instance, there could be no compatibility.

It runs some instructions in fewer cycles, and it mentions that
Mos Technology is hinting that it can with a faster clock speed
than 1MHz.

There are some subtle hardware differences between the two.

It mentions that it needs an external clock, just like the 6800 it
was supposed to be pin compatible. There is a reference to the
6502, to sell for $25, which includes the clock. As Mos points
out, despite being five dollars more, it may be a better choice
because you don't needed the external circuitry. It makes no
mention of other differences on the 6502.

This article mentions the Western Electronic Conference
(September 16-19) where the 6502 would be sold out of a hotel
suite, but in the future tense. Since that seems to be
the time when various people first got a 6502 (including Steve
Wozniak), I am suspicious about whether the 6501 ever made it
to production.

My 1976 copyright edition of Adam Osborne's "An Introduction to
Microcomputers, volume II" has no mention of the 6501, though
it does describe the chopped down variants (but not the 6507).

If I could remember some clue, I could find the info about what
happened to the 6501. I know that Byte ran a brief article some

months later. Motorola did take offense at the 6501, but since it wasn't even an extension of the 6800 (as the Z-80 was an extension of the 8080), I suspect the only thing they could complain about was the same pin-out. Certainly, that was what I remember reading. If there ever was a 6501, it was available for a very brief time and then disappeared from references. Which suggests that MOS was either sufficiently threatened, or outright forced, to withdraw it from the market.

As for WDC, I'm still thinking about where to look. A websearch turns up their page and says they started in 1978. I thought they first produced some pretty exotic CPU's but I may be mixing them up with another company. They were originally a "design center", in that they didn't release products themselves. They came up with the CMOS version of the 6502; I don't know how that came about but remember there were at the time second-sources for the 6502, such as Rockwell and Synertek. Indeed, it was those other companies that were the ones that produced the first 65C02's and there were at least two different versions of it. Obviously by the time they came up with the 16-bit CPU that included the 6502 as a subset (a software bit switched between CPU's) they were actually releasing their own products.

There seems to be more of a case for WDC stealing from MOS Technology, since it kept working on the 6502, than MOS stealing from Motorola, though I suspect that wasn't the case.

And since WDC started in 1978, and had 6502 variants in the early eighties, I don't know where Commodore's bankruptcy, which came in the late eighties or early nineties, fits into the WDC scenario.

Michael

Extra PIAs and Pokeys aren't a problem. E.g. the stereo upgrade uses the address space just above the 'first' Pokey. I've also seen added PIAs in the space above the installed one. I don't know if there is a use for extra Antic, Gtia, but in theory it's possible.

However, there can be problems with some software. Since the hardware addressing is repeated in the memory above the documented address space, there are programs using it to make reverse-engineering (a little) harder. E.g. a cracker looking for STA $D200 would not find $D210. This is also the reason why there are mono musix which sound corrupt or 'different' on a stereo upgraded Atari.

Freddy.

4859. Current Notes pages wanted

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-22 20:28:22 UTC
From: Michael Current <mcurrent@carleton.edu>
Message-ID: <mcurrent-51AAB3.15282222092002@news.supernews.com>
Source record: 27380

Hello, I recently obtained a bunch of issues of Current Notes magazine
that were published before I finally subscribed in 1991. (CN really had
a lot of great content, I always wished I had subscribed sooner.)

Anyway, in reading through all the issues I got, I discovered that
several issues had some of their pages ripped out. What's more, the
missing stuff is mostly the 8-bit coverage.

I'm wondering if someone out there has these issues, and would be
willing to photocopy these pages and drop them in the mail to me.
Photocopying, postage, and time/trouble happily reimbursed.

Here's what I'm looking for:

Current Notes

Volume 11 Number 2 March 1991 pp. 67-70
Volume 11 Number 3 April 1991 pp. 11-14, 63-66
Volume 11 Number 4 May 1991 pp. 15-18, 29-38
Volume 11 Number 5 June 1991 pp. 13-18, 63-66

Thanks for reading!

-Michael

The following is posted with permission from Paul Alhart.
=-=-=-

retrivel of information for printing, editing, or deleation.

Atari BASIC Enhancements (disk) $5

Perform DOS functions, translate error codes to English, convert
between Decimal & Hex numbering systems, and more from BASIC. Similar to
the Wedge, but uses no program memory. Works with ALL 8-bit Ataris.

8-bit TTL Logic Analyzer (disk) $5

Great project for hobbyists. On this disk is the software &
commented MAC65 source code as well as the schematic and directions for
building the required interface which can be built for under $10.

MagicCalc (disk) $5

A "memory resident" 4 function calculator for machines with
expanded memory. This program hides away in expanded memory until called
via a Hot Key combination. Calculator entry can be Decimal, Hex, or
Binary. (Divide a Hex number by a Binary number) Entries and results are
displayed in all three numbering systems. There are two versions of
MagiCalc on this disk. MagiCalc XL is for XL/XE machines with XE
compatible expanded memory such as Rambo. MagiCalc 800 is for 400/800s
with Axlon memory upgrades.

Games disk (disk) $5

Jacks Cargoship is a battleship type game for one or two players.
Play against the computer or a friend. Day, Evening, and Night time
senarios with player handicap available.

Light Pen/(Light Gun) Tic-Tac-Toe. One player game. Simple but fun.

Reconditioned disk drives. All drives come with power supply, I/O cable,
and 90 day warranty.
.
810 (no case) $20
810 w/case $25
810 w/Archiver $30
1050 $35
Rana 1000 $40
1050 w/doubler $45
Indus GT $45
.
A $15 creidt will be applied if you send me your dead drive (same base
model as ordered), power supply, and I/O cable.
.
My stock levels are always changing. Please call or write to verify
current stock before ordering.
.
Include $10.50/drive for USA S&H. Make checks payable to:

Hi there!

To grow the selection of advertisment scans on the Epyx Shrine, I'd like
to ask you to check your old Atari magazines for single page
advertisments
for single Epyx games.

Check out the current collection of 22 scans:

http://home.arcor.de/cybergoth/adscans.html

If you find cool stuff like that (...and own a scanner), please contact
me with a (short) description of the advertisment you found.

Especially I'm interested in advertisment pages for Star Fire & Gunfight
and the Lynx games now.

-> BTW: I'm only interested in advertisments in english :-)

Greetings,
Manuel

Hi there

Having succesfully built myself a Jaguar RGB cable using a 5.25 inch IDE cable and a hacksaw (I can post if anyone wants the info), I decided to see if I could
adapt the Trak Ball from the XE family to be used on Tempest 2000. In theory, it should be possible, as the game can be set to use a rotary controller. Anyone ever try this ? Please let me know. I was
lucky enough to play the original arcade game with proper spinners recently, and I need something to spin....

I am selling part of my collection. Various Atari items (hard- and
software) as well as Sinclair, Commodore, Vectrex and other
retro-computing stuff.

I am still pondering on whether I'll sell my Atari ST Book as well.
The ST Book is in perfect cosmetic condition, with PSU and battery,
all port covers present. However, on bootup it shows 4 bombs onscreen
(HDD problem?). If anyone is interested (make offer above 600 Euro)
drop me a mail.

Hi,

>....The 6507 is maybe some pence cheaper, and has less pins making
>the overall design a bit cheaper....

But was the 6507 cheaper than the full 6502?

I ask because I got into electronics, as a hobby, in 1977 and a few years later a magazine (either Practical Electronics, ETI or Elektor - I forget which) published a design for a small "trainer" system based around the 6507.

At the time the 6507 was priced at two or three times that of the 6502, in Europe, to hobbyists, at least. Not to mention that it was INCREDIBLY difficult to obtain - so much so that said magazine ended up publishing a design for a piggyback board to enable a 6502 to be used in place of the '07!

I didn't get into commercial design work until the late 80's so I don't know what volume pricing of these chips was like.

My gut feeling is that the 6507 was a cheaper chip (well it SHOULD have been) but does anyone know for sure?

TTFN - Pete.

Hi,

> Motorola created the 6800. A few designers walked out the door
>with the masks to it and started a company called MOS Technologies
>and made a chip called the 6500....

While that sure explains why the 65xx family are bus compatible with the
68xx family, I thought it was Chuck Peddle who designed the 6502 processor?

Also, from an architectural/software point of view I don't see any real
similarities between the 65xx and 68xx families.

After all, the 6502 has a pair of 8-bit index registers (X and Y) and an
8-bit accumulator (A). The 6800 has a single 16-bit(?) index register (X)
and a pair of 8-bit accumulators (A and B) which could be used together to
form a 16-bit accumulator.

This affects so many things at such a basic level that I cannot believe that
MOS could have used the 6800 masks for anything other than a basis to design
a completely new product from, IE they just used them to see how it was
done.

TTFN - Pete.

4872. FS: Multiplexer

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-23 18:57:52 UTC
From: bill@newbreedsoftware.com
Message-ID: <QuJj9.28933$lk.639390@typhoon.sonic.net>

I have a Multiplexer setup I bought from CSS a few years back,
and which I no longer use.

I didn't end up using it for much, actually.
Although I did write "MuxChat":
http://www.newbreedsoftware.com/muxchat/

I had been planning on eventually writing an X-Window-like graphics
server which other slaves could talk to and use for displaying
'multitasking' programs.

Anyway, I have two Mux OS ROMs, two slave cartridges, and the master cart
and cabling.

Sold new, it costs about US$150.
(http://nleaudio.com/css/products/multiplexer.htm)

I'd be willing to part with it for US$100.
I'd also rather not split up the set, since it would make what's
left useless to most people.

E-mail me if interested.

Message-ID: <amo639$7mve9$3@ID-15679.news.dfncis.de>
Source record: 27297

Hi,

>....all the 8 bit's had their strengths. c64 and atari is the only
>though ne but hte apple was expandable to anything. but Atari's
>were bought by people who loved the heck out of computers who were
>not allways rich enough to buy an apple that would cost a fortune.

Gotta disagree a little here....

Ataris were bought by people who wanted the most techically advanced system
and/or loved video games!

Although the Apple][was infinitely more expandable, by the time the Atari
appeared here in the UK in 1980 the Apple was looking VERY long in the tooth
(it was designed two years prior to the Atari after all). Not to mention
horrendously overpriced.

>....c64's were bought by families. often for kids by computer
>ignorent parents....

I think the main reason for this was price, the C64 was quite a bit cheaper
than the Ataris when it was released over here.

I agree with your sentiment though. Although the machine was a fine piece of
hardware, it was BADLY let down by it's peripherals and system software.

That aside, I made vastly more money in the mid-80's writing stuff for the
C-64 than the Atari.

>....we as atarians were the real hardcore users....

I think that owners of all machines would make that claim, IE THEY were the
real hardcore. It's a matter of perspective.

>....and we paid for it by being put out of an industry that
>we started.

Atari may have started the videogames market, but it wasn't until machines
like the ZX-80, ZX-81, Spectrum, Oric, C-64 etc came out which were CHEAP
that the industry really kicked off big time.

And we weren't put out of the industry as such....Atari failed due to their
legendary gross mis-management. :-(

> atri also was very secretive.

No they weren't, they were one of the most open companies out there. How
many other companies published full schematics, operating system listings
etc etc?

TTFN - Pete.

4874. FS: Sweet16 (65C816 CPU for Atari 8-bits)

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-23 19:08:07 UTC
From: bill@newbreedsoftware.com
Message-ID: <rEJj9.28942$lk.639267@typhoon.sonic.net>
Source record: 27393

I have Fine Tooned Engineering (FTe)'s "Sweet16" CPU upgrade for the
Atari 8-bit which I really have no need for.

It's a little CPU with some additional chips underneath.
You just pull out the 6502 and drop in the 65C816.
No wiring or soldering needed.

(Note: NOT to be confused with the "Turbo-816" from Dataque;
I don't know anything about that, or how it compares.
Also NOT TXG's "65c816 Project," as seen here:
http://www.myatari.net/issues/jun2001/8_16.htm)

I'm not aware of TOO much software for the Sweet16, although I believe
there's a 16bit version of the "MAE" assembler, which means you can
build 16-bit programs right on the Atari. (I also assume that MAE can
compile 8-bit programs a bit faster if you use the 16-bit version.)

I'd be willing to part with it for US$100.

Please e-mail me if interested.

It wouldn't matter because all it would have done was change the price maybe
a dollar.

Hint: You don't have have the traces tied to all the lines. The 6502 and
6507 were not much of a price difference. Even I could have got a 6502 for
$3.00. The rest of the design would have still been the same. It you only
wanted 4 KB, all you do is tie traces (to and from the memory) to only 12
pins. Only have 12 traces.

Hi,

>> My gut feeling is that the 6507 was a cheaper chip (well it
>>SHOULD have been) but does anyone know for sure?

> It wouldn't matter because all it would have done was change
>the price maybe a dollar.

OK, I'll admit I was being a tad vage....the 6507 *SHOULD* have been a cheaper device than the full 6502 since it was being aimed at the embedded controller/small system market.

That said, since AFAIK both processors used exactly the same die just how much cheaper was the 6507 in quantity?

However, even if it was only a dollar cheaper that would make a hell of a difference when you're buying them in quantity....companies like Atari would be buying tens of thousands at a time!

> Hint: You don't have have the traces tied to all the lines....

AFAIK Internally the 6507 was identical to the 6502, IE they used the same die, just that they didn't bring out the upper four address lines.

This would effectively give you a 64K address space made up of 16 reflections of the lower 4K. Which, as you say, is the same as leaving the upper four address lines of the 6502 unconnected.

>....The rest of the design would have still been the same. It you
>only wanted 4 KB, all you do is tie traces (to and from the memory)
>to only 12 pins. Only have 12 traces.

Ah, but you're missing the other main feature of the 6507. The 6507 came in a smaller (28 pin??) package, rather then the more standard 40 pin package that the 6502 came in.

TTFN - Pete.

Smaller package (28 pins instead of 40) = cheaper package.
Smaller package = more chips per tube = cheaper shipping.
Less holes and smaller footprint = cheaper PCB.

>However, even if it was only a dollar cheaper that would make a hell of a
>difference when you're buying them in quantity....companies like Atari would

Then why doesn't he listen to us and stop posting so much? And why doesn't he "try to support one another"? Have you read his rant about those selling Atari items at auction? BS doesn't care about supporting the community, just about making maximum profit for himself.

If you want to keep posted on his business perhaps you should ask him to start a mailing list for you.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:
alt.binaries.atari

4891. Using a trak-ball with centipede?

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-24 14:54:42 UTC
From: dunxuk@aol.com
Message-ID: <20020924105442.23190.00000505@mb-fp.aol.com>
Source record: 27311

Centipede seems to have some inherent trak-ball capability, using control-T on the attract screen changes the behaviour of the zapper (it seems to go relentlessly to the right, a bit like Jack Straw). However this appears to always be the case, trak-ball connected or not.

Is it configured for some exotically-wired trak-ball?

Also anything else other than Missile Command and the sod-awful Slime that take advantage of a trak-ball in TB mode?

TIA, Dunx

Make sure you flip the trackball over and switch it from joystick to
trackball mode.
>

Missile Command definately, don't know about Slime.

Source record: 27317

Well, I'll say this again, he's been dealt with. I do system administration duties for some private providers in my region and I've spoken and exchanged email his provider admin. Wonderful administrator on that end and also an atari enthusiast like ourselves. Ben is to prefix all commercial subjects with ADV: and limit the commercial posts to once a month. I think that is more than agreeable. If Ben has something major to give back to the community then I'm sure one other post in the mix wouldn't be so bad. I see him posting nothing more than commercial related posts and that is spam. The morning that I posted what I did was right after a night in dealing with a spammer that blatently refused to read an authorized usage policy and led me to cleaning up a few thousand emails and dealing with all the complaints.

I may mostly read through the atari groups but I've done my work in giving back to the A8 community over the years. My slightly non-functioning hardware has led me to the emulators and with little time for that but I try and keep up. Everything I provided was for zero cost and I enjoyed doing it. What I see with Ben is that it's soley a business; I don't see him offering much else. When and if I get the chance to rebuild my 8-bit system, I am going to go with someone that doesn't spam for business and someone that happens to be in my own country!

If you agree with Ben's practices, get him to do an opt-in mailing list and you can enjoy it. If he doesn't follow the guidelines set by his own admin then I'll chat with his admin once again. And he is a lot tougher on spam than most people but we both agreed that Ben should probably post once a month for any changes or whatnot. That's all fine and good.

When I come here, I enjoy reading opinions the various opinions, updates, and other articles from the common A8 folks (Mathy, Tom, William etc). I don't care for reading a bunch of spams. And when I want to find even more information on what's happening in the 8-bit world, I typically go to Google and search, which usually leads me back to the websites created by the common A8 folks here :)

Cheers!

- Shangrila

I'm having the same problem. I tried missile command, never knew about the control-T, tried it and man that trackball is a great peripheral. very accurate, right sensitvity, playing mc was a blast. However I tried control-T in both centipede and millipede makes no difference, only works properly when switch is set to joystick mode.

Ha! You've been there too? One of the devices I helped develop had a mistake made by the project manager on the price of one componet. I had reported it to him accurately but he made a mistake moving a decimal point over that reduced the cost by a factor of 10. This was the difference between 1.5¢ and 15¢ in the cost of a device that was going out the door at $18-$20. I still remember him telling me that I had killed the entire project with *my* mistake.

One of the things that hasn't been mentioned yet is the added expense of drilling 12 extra holes and manufacturing fall out/costs on everything from dull drills to bent pins and solder bridges. There are several good books out on the topic that illustrate QC/product fallout is one of the most effective cost effective activities you can pursue. Nothing is more expensive in the chain then having a solder bridge because of one of those extra pins and having to either rework or toss out a populated board.

Probably anything that works with an ST-mouse on an 8-bit, like Operation Blood (or was it the sequel?), Mines, BOSS-XE, GOS, and
probably ATOS.

>someone that happens to be in my own country!

What country he is in has absolutely nothing to do with it, you don't
use the net and then start putting barriers up. If you feel the need
to limit your purchasing avenues based on dislike of a person who
really has no effect on your reading ability then more fool you.
>
>If you agree with Ben's practices, get him to do an opt-in mailing list and

Again, this smacks of Netcop....

Sorry, but the common definitions of spam don't apply 100% to Ben,
he's posting ON TOPIC and he's posting items related to the groups.

What he's not doing is following approved *guidelines* with relation
to frequency and the accepted practice of ADV: or COMM:. Hardly
hanging matters.

And how can you say he gives nothing back, nonsense...

He's selling products people on these groups want, he's finding items
that people on here want. What would be more important is if he rips
people off which judging by the many posts it's safe to say he's as
honest as they come and offers a very good service for *Atari* people.

My feelings are that you took a dislike to Ben's stuff and decided to
stick it to him, please don't make it sound like you are doing the
group a favour as it's been clear that a lot of the group support Ben
all the way. I'd say once a week would be more than acceptable which
is not far off what he was doing anyway, the fact you seem to sound
like it's a personal netcop thing isn't too clever in my book.

What you point out is that Ben is a business and that's all he is,
whilst this may be true posting wise it's ignored that he's a business
aimed at the very people in here and your actions could affect his
sales which then could lead to him NOT supplying the very goods people
in here are trying to buy. So rather than you giving something back

you could end up taking AWAY...

He's not a get rich scheme (and I doubt he'll be a millionaire from Atari bits), he's not posting re non related items. He's just a bloke posting maybe a few too many adverts with a questionable attitude re Ebayers (which is daft but it costs him).

This is just my 2 quid on the matter, nothing personal....

No, I realise this, because its still just left and right movement... But
the wheel inside the trackball can be adapted. Also, you can turn the
trackball on its side and this is pretty good too.

Too much to list them all. Try to search for:

-Chaos Music Composer
-Music ProTracker
-Black Magic Composer
-Theta Music Composer
-Advanced Music Machine
-SoftSynth
-Soundmonitor Professional
-Bankstreet Music Writer

etc, etc,etc...

Not even mentioned the Midi- and Digi-composers, MOD-tracker and Drummerbox'...

I'm not surprised it went fast. I remember at the ACE'95 show in toronto
Mike hohman said he'd only shipped 6 or 7 of those upgrades at that date.
And that wasnt too long before he went under / dissapeared.

>
>TIA, Dunx

As far as I ever knew, it was just Missile Command and Centipede that used the
track ball. I cannot think of any other game that might be good to use with
the track ball.

I take spam personally, to each their own... it is spam by definition
(unsolicited commerical email/postings)

>
> What country he is in has absolutely nothing to do with it, you don't
> use the net and then start putting barriers up. If you feel the need
> to limit your purchasing avenues based on dislike of a person who
> really has no effect on your reading ability then more fool you.

Again, it was a remark to say I'd be buying close to home and have no
tolerance for spammers. Seeing commercial posts which I have not asked for
is definitely not someone I'd buy from.

> >
> >If you agree with Ben's practices, get him to do an opt-in mailing list
and
> >you can enjoy it. If he doesn't follow the guidelines set by his own
admin
> >then I'll chat with his admin once again.
>
> Again, this smacks of Netcop....

Amazing how many people out there have no idea about how the net works...
and I find many people supporters of spam or they're simply ignorant.
Again, to each their own.

> And how can you say he gives nothing back, nonsense...
>
> He's selling products people on these groups want, he's finding items
> that people on here want. What would be more important is if he rips
> people off which judging by the many posts it's safe to say he's as

>

Then let people find his website in a search for atari goods and not by
unsolicited posts. If he wants to pay per post or pay per email then I'll
very gladly accept his commercial postings.

> My feelings are that you took a dislike to Ben's stuff and decided to
> stick it to him, please don't make it sound like you are doing the

> posting maybe a few too many adverts with a questionable attitude re
> Ebayers (which is daft but it costs him).
>
> This is just my 2 quid on the matter, nothing personal....
> --
> Paul
>

And my 2 cents as well, I'm just ignoring and killfiling the rest of this thread since too many people have no clue whatsoever about how the net works. Ignorance is bliss... I dislike spam and will continue to do something about it when it comes to something I've supported for many years. Fortunately I don't care whether anyone agrees or not. If you do, great, if not, great. I might suggest reading up on certain usenet guidelines and RFC's as well as talking to some of the very old sysadmins over in News Admin Net Abuse and see how long you last there with similar comments...

Enjoy!

Thank you Kevin for providing the front page of this website, a couple years ago I used on of the search engines to find De Re Atari for myself, but I could not find the front page.

I had archived as much as I could to disk so that I could print it out later.

Once I get my Atari 1050 Disk Drive repaired I will be able to play AstroChase again.

At least I can still play Deluxe Invaders by Roklan and Atari's Asteroids & Pac-Man on my Atari 800XL.

Didn't De Re Atari help out well at teaching people to write programs for all 8-bit Ataris?

Wally

4913. BUY FROM BEN SMITH AT BRAVO SIERRA COMPUTERS

Source record: 27334

this is pure good service, can you imagine a company that will call you
back and help you on there own quarter.
he has even called customers back in other countries! that is a amazing
record of service!
i have known ben for 7 years now, and i have sold to him, as well as
traded with him.
and i have never, repeat, never had a problem with ben.
there are how many atari dealers left in the u.s.a.?
you should be happy that he posts here.
i have had customers call me about ben having seen his posts on atari8,
and they never post, they were only looking for a atari dealer.
so going after the only dealer who DARES post here is stupid, you have
no idea how many atari users who do not get involved in the discussions
here are only looking for support.
drive the last dealer away and you will drive away disgruntled users
who will not be able to find support.
they will give up, and go to the peeceee:(
ben is a guy who sells what other atari dealers do not.
he has unique products at fair price's, where can you buy tested used
software with a guaranteed warranty?
if you drive him away i will place his add weekly.
lance
Hi, I'm Ben Smith of Bravo Sierra Computers. I sell Atari Computers and
Atari Jaguar Games. The Great Communicator once said, "It's a Recession
when It's in your Neighbor's back yard. But when It's in your back yard,
it's a Depression!". Usually Atari sales depend on Customers with extra
income. Money over and above what it takes to pay bills. This has cut
into my livelyhood. With the current economy as it has been. I'm looking
for Atari Customers with extra income! Especially repeat customers
familiar with the way I do Business! So check my HotLinks below, E-Mail
me at atari@aracnet.com or call Ben anytime at (503)256-9974! I'm not
asking a lot, I'm just trying to make a living and I'd like to earn your
Business!

From: jirinej@volny.cz
Message-ID: <7e29a94a.0209242226.5a0f942@posting.google.com>
Source record: 27335

Hi, can please somebody can simply explain how (where) to run *.bin and *.exe files (Atari 800XL/130XE). I downloaded XFormer 2000 (ver. 8.00) and I am able to run only *.atr files. Do I need another emulator ? Can I make *.atr from bin, exe ? If yes, how ? Thanks.

4915. Spindizzy game

Hi, can somebody execute game 'Spindizzy' (Atari 800XL/130XE) on some emulator? I have XFormer 2000 ver. 8.00 , the file Spindizy.atr has 35 472 bytes and was created 21.10.1997 . When run, it always crashes. Or has anybody different file ? Thanks for any advice.

I did a search on my XLSearch.Atari.org site and found a ZIP file with
a 35,472-byte ATR file. I fired it up in Atari800 (in NTSC mode, even),
and it seems to work fine.

Neat game - I'd never seen it before.

-bill!

150 EURO? Good luck... [if I put it up for that amount my inbox
runneth over]

650NLG? Well done, you got a good deal on that, but it ain't gonna
change the fact that this ST Book is not leaving my collection for
less than 600 EURO. Hell, I find stuff that is sold on ebay for 400$
for 20 EURO sometimes, and there are people who throw an Apple-I in
the trash. I did have another ST Book but that was in a very bad
condition, had no PSU, no battery and it sold it for 450$. So there
you go.

Offer > 600 Euro it is, pix are up on the website
(home.quicknet.nl/qn/prive/sa.karsseb/ebay/)

And the peasants rejoiced....

Dear Lance,

Thank you for your kind and supportive words for Ben Smith of Bravo Sierra Computers. I too have known been for many years, and he has proven to be a very honest helpful vendor of Atari hard and software. It is very sad that some individuals in the Atari Community have shown such negativity to his advertisements which have been so helpful to so many. The Atari Community should be a tolerant and enthusiastic place where many people of different backgrounds can freely share their passion for Atari computers. Thanks again!

An Atarian Forever...

4922. Atari 8-bit History Site?

He may over do it on some of his posts, but I would think these people are old enough now to use a killfile or simply DON'T read them if they bother them. :)

I'm totally behind someone who wants to continue to support Atari in any way. It seems most people who step up to theplate get shot down because some people's ego's are too high or they don't agree with the project or it's goals. They then harass this person to death trying to prove their point. When it's all over, the person gives up and moves on to another platform.

I don't agree with Ben's views on bidding and etc, but support him for supporting the Atari community. For everyone else who doesn't like his ways, grow up, get over it.

Lannie

OK, flame away.. :)

You might like to have a look at my Atari 8-bit CD-ROM which includes
Digi-Studio, a full music creation system for use with digitized sounds,
along with many other Atari products. Check it out at
http://www.dgs.clara.net (click the CD-ROM option).

Don't you think they use Lasers to cut the holes. No longer longer a need
for drills. Yet
this was available to companies like Commodore and Atari. The question maybe
a at most a little cheaper
and yes at 100,000 unit shipment, well you are talking about an overall
price difference. Still doesn't make a d*** difference on the per unit price
of the console which is only a $99 unit. Just sell it for $99.99 a piece.
which is $100 and gain that $1.00 addition in price. Tighten the trace
circuits a slight further. (Bring the chips slightly closer) makes the PCB
smaller.

All that price difference is easy enough to counter in a $1 increase in
price per game cartridge. Figure a $45 cartridge equal $46.00.

4940. Re: read atari text format files in Windows

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-25 21:07:44 UTC

Message-ID: <AApk9.2965$Nj2.238313@newsread2.prod.itd.earthlink.net>
Source record: 27259

I believe WordPad will handle the atascii eol and properly display Atari text files not including the control character graphics. I often use Ken's Atari Util for Win to display atascii text and even tokenized Basic listings.

M65 is another matter; its default save format is tokenized in a way analagous to Basic. Ken is reportedly pursuing that, but my copy cannot detokenize the M65 files.

> I'm particularly curious about the Midi composers. :) Is there hardware to
> connect an XE to MIDI equipment?

Yes. Both factory-made (not available anymore) and homebrewed projects. I don't use MIDI, but I'm sure other people over here
have used it, or still use it, so they can tell much more about it.

I do have a very simple MIDI-interface myself which connects to the SIO-port, but this one only plays MIDI-files (has only
MIDI-out) but there are much more advanced interfaces out there which connect to the parallelbus, and also a SIO one that has both
MIDI In-and-Out...

To the bloke that likes to threaten...

You best back off son....You play silly buggers all you like with what you like but don't you dare email me threats about what actions you will take with me..

Of course you can come and meet me face to face if you like to warn people?

Somehow I don't think you do...

I've been in this group for going on 10yrs, I've sold the Atari for a living, written for the Atari mags, beta test the emulators, posted and helped in here and supported the collection of classic material ..

And you have the f**king cheek to tell me I'm causing trouble because I dare support Ben and you don't like it. Ben's his own man and if he's been setup to post at whatever interval then that's between you and him..

Keep me out of your ego son, kill file me if you want but do NOT send me warnings!!!

My ISP and News provider have been emailed a copy of your message...

Sorry folks for this rant, I'm one of the good guys and then suddenly a supposed fellow Atarian thinks he can throw their weight about..

Not impressed...

>emulator ? Can I make *.atr from bin, exe ? If yes, how ? Thanks.

Older versions of Xformer did allow to enter the names of the disk images on the comand line. If you entered a bin or exe or bas file on the command line, it would automatically create an internal .xfd image for it so that you could and use the file. I do not know if the latest versions still support that. If you use the older version, you can load an atr and a bin or exe and then copy the bin or exe to the atr or xfd file. In the old docs it tells you to specify the full path of these files on the command line.

Another option is using one of the utilities on the PC that will let you put these files in an atr image. Take a look at http://members.home.nl/stack for the program dir2atr and there are some more similar utilitites.

Keep those XL's/XE's humming.
Ernest.

You can try my wav2cas program to make a .cas file out of your
cassette. I assume you do not have a cassette unit? Otherwise there
are utilitites to copy cassette data to a 1050. Once you get it
repaired of course. You can find it on my home page
http://home.planet.nl/~ernest

Modem should also work, if you have the file on the PC. So it is not
a dumb idea either.

Keep those XL's/XE's humming.
Ernest.

Laser drilling units in 1979? For a little company like Atari? I don't think
so.

Wildstar, please get a sense of proportion. Technology costs go down as you
go forward in time, which means that they go UP when you go BACKWARD in
time. We're talking about stuff that happened between 20 and 25 years ago! A
Commodore 64 cost US$600 when it was released.

Source record: 27274

Expect a lot of questions from me, simply because I just got my XE for free and am rather curious. :)

Is there any other, more modern, way to store files than the 5.25 disk drive I currently have?

I'm looking to use my XE as a MIDI sequencer, as a free sequencer is better than no sequencer. If anything, as something to toy with. :) I'm hoping there may be some way to avoid using 5.25 disks, simply due to the clunkiness of using them...

Thanks!
Opti

Actually I worked with Coherent Radiation CO2 lasers as it related to drilling holes in polymeric substrates I will uncatogorically say it was not ready in the 70s.

Ironically the problems I saw, the puff of colloidal particles causing dispersion of the beam and inaccuracies in the hole were duplicated in the "Star Wars" defense programs. It was one of the things I am sure the Russians figured out as a cheap defense for directed energy weapons. Just coat nuclear warheads with any crap and the puff of smoke prevents further damage.

The only way around this is multiple pulses which end cost time and money. I wish I could remember some of the numbers as I actually knew them many years ago. The bottom line was for all but the highest quanties of production you are better off buying a cheap drill and a minimum wage assembler. The Atari VCS probably would have qualified but I am sure low production items like 850 interfaces would never have covered the cost of set up and capitol equipment costs.

>I currently have?

You have these options:

XF551 Drive, and upgrade it to handle 3.5" disks.
Connect a hard drive to your atari (various home-brew and commercial.)
SIO2PC cable and software (PC to Atari connection.)

Personally, I would go with the SIO2PC first, then try to build/buy a hard
drive interface if you think that is useful. Check out the newsgroup FAQ
for tons of information about the Atari (it is posted here frequently,
check Google Groups for it.)

If you are real Atari nut, you will probably eventually have all three.

Why not just use the pot inputs of the Atari joystick ports? Several years
ago I contemplated that idea and wrote about it (either "Atari Controller
Notes" or "Joystick Miscellany", you can find them on the web and on
Google's Usenet archive).

I'm sure your response struck fear in the heart of the dastardly e-mailer
and we'll never hear from him again. :)

4967. Re: Other Storage?

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-26 13:32:39 UTC
From: Pockets <jp@pockets.dummy.cix.co.uk>
Message-ID: <amv29nhgt1@thorium.cix.co.uk>
Source record: 27287

The Atari had datarecoders (audio casettes) 5 1/4 inch disk drives and hard drives available during its production run.

3 1/2 inch 'stiffies' (as we used to call em) and ide hard drives were usualy the result of DIY projects or kits from 3rd party suppliers. Basicly beyond the ability of a 'mear user' like me.

As has been pointed out the SIO2PC cable is proberbly the most cost effective and flexiable idea for your needs. With the right software it enables your PC to Emulate disk drives and other devices.

http://www.faqs.org/faqs/atari-8-bit/faq/ has the most valuable chapter headed
"Subject: 10.3) What is SIO2PC?" which has links, specs and the basic run-down.

Hope that helps.

You do what I am doing, but you an Atari ST computer which does not cost much these days. You would also need a SIO2PC(ST) cable. There is a program called 800XLDJ which emulates an 8-bit disk drive. It reads files from the ST that can either be on a CD or a 3.5in disk. I am putting all my 8-bit programs on a CD and will the 8-bit XE read them from there. Beats using the 5.25" disks. Email me if you need more information...

4971. What printer tape catridge for ATARI 1029?

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-26 17:34:54 UTC
From: "\"Patrycjusz R. Łogiewa\"" <silverdr@inet.com.pl.remove.it>
Message-ID: <3d934502$1@news.inet.com.pl>
Source record: 27291

Hi,

does anyone know what type of catridge should I buy for the 1029
printer?! Certainly buying a new cartridge "for Atari printer" may be
difficult ;-) but I am almost sure that it shared the mechanism (and
ink-tape catridges) with some other (more printer specific) brands.

Any clue?

You would be suprised. In Europe, and especialy the UK the ST and MIDI
software still seems to what the dance music industry uses, Even 'Fat Boy
Slim' still does his demos/roughs on them. As a result every wannabe DJ
wants one, and the price has been kept quiet high!

You may be disappointed in using the XE as a midi sequencer -- not because of the XE but because of the lack of really good software for it. There are some packages (see the FAQ for this newsgroup) but they can't really compare with what is out there for more modern computers. Basically they step-record one note at a time. It can take forever to do a song. But if you can work within that framework, then have fun!

Take care.

I'm indeed suprised since I'm from Europe too (Netherlands) and the most expensive ST I have (Atari 520STFM) did cost me about 12,-
Euro, and only cause it was a new one. All other ST's I have I got for free...

He's probably trying to do both: make a living, AND support the
community. It's certainly nice to have a source when you need to buy
something, and not have to watch eBay everyday *hoping* someone will
auction what you need, and *hoping* you can get it without selling off
your youngest child in order to afford it.

4978. New CD -- update

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-26 21:53:35 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1033077364.97792.0@demeter.uk.clara.net>
Source record: 27148

Hello All,

Just wanted to update you on the progress of my second Atari 8-bit CD-ROM. The 22 minute video of the AMS 96 show has now been transferred to MPEG-I format and will appear on the new CD. Here's what's confirmed so far:

* Print-Filer from Rambit
* Alien Blast (light gun game)
* Demo Maker/Edit 7
* AMS 96 Video
* DGS PD: Bash-A-Drum, Dean's Desktop system, Programmer's Speech Tool, This&That Disks 1&2.

I would still like people to make suggestions as to what other PD from the DGS library they'd like to see on the new CD. Please have a look through the catalogue and let me know what you'd like on there.

The first CD of DGS/PPP products is also available to buy on my website.

Web site: http://www.dgs.clara.net (click the Catalogue option for the PD catalogue, and the CD-ROM option for info on the first CD).

Dean Garraghty

4980. Using a trak-ball with centipede?

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-26 23:18:32 UTC
From: Roy G Biv <erasmus@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.33.0209261841370.16742-100000@shell1>
Source record: 27150

On Wed, 25 Sep 2002 at 02:22:35 GMT "Edward S. Baiz Jr." of
attbi dot com scribbled:
->I cannot think of any other game that might be good to use with
->the track ball.

Sure, but still.... Ever try playing Atari Pac-Man or Ms. Pac-Man
with a trackball?! It isn't "good" but it IS challenging! <grin>
After I peaked out at those games, playing them in some unusual or
unorthodox manner was the only way to get a new challenge.

Using a trackball was one way. Another was what I called the
"Anti-bonus Game" -- especially in Ms. Pac-Man -- where the rule is
that you can't munch on a bonus fruit or bonus ghost. In the regular
rules, those earn bonus points. In this version, the game is
immediately lost! I.e., it isn't just "Game Over." It's "You Lose!"
-- as well as "game over." <grin>

This kind of variation could only be played on the home computer,
since the arcade machines (back in the olden days when those games
were popular) didn't allow any choices on rules.

The "Anti-Bonus Game" had to be played with a different style,
since bonuses had to be avoided at all cost. Playing it tended to
ruin one's "technique" for playing the regular game! <grin>

Another Atari computer video game that worked well with a trackball
was Space Invaders. (The better and more authentic version of which
was called Deluxe Invaders.) For that matter, what about Asteroids?
Or Joust? There are probably many other (classic) video games that
could be added to this list, where the trackball was either good or
a "challenging" alternative.

From: "Mark W. Smith" <msmith@optonline.net>
Message-ID: <B9B94DBE.3740%msmith@optonline.net>
Source record: 27153

I hadn't paid attention to the postings on this Ebay auctioneer and purchased a 1050 disk drive. Upon re-inpsecting the description I noticed there was no mention of a power supply. Sure enough it came without a power supply. Secondly, the description of the drive does not match its condition.

As a veteran Ebay buyer, even I got caught with my pants down. Always check the details, and if time permits, query the auctioneer. Honestly, I have spare power supplies, but people like this are into the auction scene to purposely deceive and to maximize profit. As the other postings stated, "Buyer Beware"

What I'd really like to see on a CD is the whole PD library:-) Should be
plenty of room! If you don't mind the 60 weeks copying them all to your
PC...

Hello Paul,

I have a suggestion that might help. With the offending anonymous E-Mail.
If you get an E-Mail, and you wan't to know the real E-Mail Address of the
offending E-Mail, try saving the original E-Mail as a text file, then load
it into a text editor. It should have an extra hidden line at the top of
the E-Mail that shows the real E-Mail Address.

Also, I never received a reply. Are you interested in an Atari Jaguar Game
Night coming up here in Portland, Oregon USA?

==Thanx==
===Ben===

Can anybody translate this Turbo-BASIC-Code into assembler:

```
10 dim pic$(7680),txt$(7680)
20 rem pic$ is a background picture
30 rem txt$ is a picture witch contains text in graphic 15
99 ------------------------------------------------
100 pic=adr(pic$):txt=adr(txt$):scr=dpeek(88)
110 for p=0 to 7679
120 poke scr+p,peek(pic+p)!peek(txt+p)
130 next p
```

this routine should be called using the command

```
A=USR(routine$,pic,txt)
```

can anybody do this? I would like to have the source code (ATARI-ASM or ATMASII).

I wouldn't suggest posting messages personal copies of any email in a comp.sys group when you have no clue.. Email wasn't sent by me and he linked an anonymous email server without _any_ verification at all. All messages I see here that are abusive will be sent back to the source ISP. As far as you are concerned, yes, I do have 1000 times your intelligence and am God since I don't go around copying what appears to be email , and could very well have been made-up, into a group where it shouldn't have been posted in the first place. Admins don't care much for that. I'd be very careful how you proceed with this since I know what I'm doing. Appears you don't. Learn how to read email headers before making stupid comments.

Enjoy!

- Shangrila

You might want to check out Atasm, which offers compatibility with Mac/65.
http://www.cs.utah.edu/~schmelze/atari/atasm/

Not a windoze app, and doesn't have the nice integration with text editors
like xasm though, but great nonetheless

Body handling: HTML body converted to readable text

Paul,
they are images of a whole diskette, not just a .bin. There's a 16 byte
header tagged on the front for the emulators' benefit.

As much as I'd like to put the whole library on the CD, I feel it would be pointless because such CDs of PD already exist. It would also take me forever, and I just don't have the time! What I will put on, is any PD written by me, or specifically for me. Or any that people ask for, although nobody has asked for anything yet!

I bought a NOS Demon Attack recently (one of my favorite games of all time), and I finally got to try it out last night. Much to my dismay, I found out the hard way that the Imagic cartridges don't work in the 800xl, just straight 400/800 machines. At least that's what I've been told. Anyway, I have this cart now, and I hate to see it go to waste. So, if anyone could use it please let me know. No charge, except for the cheapest shipping amount I can find.

James

In my case I tried cleaning and got no change in the results.

The fact is that when I moved from my old house to my new house I think that my Atari 1050 Disk Drive got jostled.

I do have an old Atari cassette tape recorder/player/drive, I just don't
much care for using it anymore.

I bought the cassette of "Avalanche" because I have a cassette tape
recorder/player/drive.

Would you be able to tell me how I can convert some of my old programs to
run on my Atari800Win?

I especially want to convert a few of my favorite games that I copied from
Compute, Antic & Analog Computing magazines.

Amateur Atari historian and Devout Atari game player,

Wally

Unfortunately, ALL the headers can be forged... you may be able to see the route the message took from the first SMTP server to yours. Also unfortunately for you, there are anonymous remailers and a million open SMTP ports around the globe to bounce this crap through. I imagine if there is a real threat and you want to involve the police you may be able to trace even these... depending on how seriously the police take the threat I guess.

In this case, I would send a message to the orignating SMTP servers domain abuse contact and leave it at that.

If you (the man in question) think you are a powerful sysadmin and you know how usenet is supposed to work, try taking on hipcrime and his cronies at Da ta ba six. Good luck!

Couldn't this routine have a possible problem with the screen memory
crossing a 4k boundary? I guess it depends on how BASIC allocates the
string space...

Could only be a problem when address 88 points to a wrong location. If you
do a GRAPHICS command, this location will be set correctly and you can use
it as output buffer.

Freddy.

5004. Getting Rid of RFI?

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-28 02:26:32 UTC
From: llpwhite@cs.com
Message-ID: <20020927222632.22770.00000304@mb-fb.news.cs.com>
Source record: 27175

I am using my 130 XE with my PC monitor by way of an S-Video input on my PC's video card. The Atari picture quality is very, very good, but I still have a little problem with what I would call "pulsing" at the (apx) top 1/4 of the Atari screen. I have a clip-on split toroid (sp) on the S-Video cable, and recently installed another on the power supply cable to the XE. Adding the toroid to the power supply cable was quite helpful. (I remembered that some XL/XE PS came with toroids installed.) Does anyone have any good info on using toroids or other methods to get rid of RFI? A Google search produced very little useful info. Also, moving the cables does not help.
Thanks,
Larry

Doh! Of course, I read over the routine quickly... I thought they were
changing location 88 to point to one of the string address!

Thanks for the clarification.

Laser units where around for QUITE awhile and Atari ran off the finance backbone of Warner Communication which was a fairly large comapany. One Laser drill was $1 million then. I can build one by cutting a ruby and use of a few mirrors, magnifying glass and some stuff. Making one can be done sort of inexpensively. Basically focus a high concentration of light through a ruby and you get a ruby laser. At the right frequency and intensity it will cut.

Though building one from home is hard but with a company expense it isn't a problem. Just need a Ruby,emerald or Saphire. That's the key component of a laser. They are not a Billion dollar device for corporation only for general public. Besides they only add two to four digits for general public so its above financial reach for home use.

Lasers where used in the early 70s and Atari handhelds where late 80s. Lynx for example was late 80s.

Hi, I'm Ben Smith of Bravo Sierra Computers! Your Benefactor, an Atari Dealer. Offering Sales, Support & Service of Atari HardWare, SoftWare, Books & Accessories for the Classic Atari 8 Bit and Atari ST Computers plus the 64 Bit Atari Jaguar Game System. I am a Reseller of Used & New Atari Collections! Much of which were the Treasures of Former Atarians, Locked away in Dungeons, now given New Lives, offered to be sold as New found Treasure, back in Circulation in the Atari MarketPlace. Hidden and Forgotten, Now set free from the secret hiding places. Atari Heaven where former Atarians had left them to Die. Saving Wondrous Collections from being irretrievably Lost! As well as Saving entire inventories from defunct Atari Dealers, much of it +NEW in the BOX/BAG! After Languishing in Forgotten Warehouses, long abandoned by retired Atari Dealers!

I love saving my customers money! I mainly use Postal Delivery! I save money for my customers when using Postal 2-3 Day Priority Mail & Global Priority Mail. I use Packaging supplied by the Post Office for free and Pass on the savings. I sell Atari, I'm not in the Business of Profiting from Marking up on the cost of Shipping! And just like the Postal Service I avoid making promises I cant keep. The Post Office sends Packages by 2-3 Day Priority Mail. They don't promise 2-3 Days but they have a Good record of Following through! Once I receive payment, your order usually goes out the same Day! This is not a Promise, but like the Post Office I have a Good record of following through! Ask my Customers! I also have Libraries of Reference Books for the Classic Atari 8 Bit and the Atari ST Computers! I have ways of saving Money on Postage by Sending it Book Rate. I also have some tricks for saving on Postage when Mailing outside the United States! I Ship Atari anywhere the Law allows! If you dont come to me, I cant save you any Money!So check my HotLinks below, E-Mail me at atari@aracnet.com or call Ben anytime at (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

Got Atari Questions? E-Mail or Call Ben 24Hrs, anytime at (503)256-9974!
http://www.aracnet.com/~atari/numbers.htm Phone contact info and Hours!

depends on whether you mean for a real atari or not,
more about it (and everything else) in here (somewhere!)
http://www.faqs.org/faqs/atari-8-bit/faq/

Ape or SIO2PC on PC linked to Atari with special cable, will let a real
Atari read them exactly like a real diskette, so you can do what you like
with them then, even copy them to a real diskette.

Ahh, here is a utility that should convert between the different emulator
file format types...but making a .bin or .exe of a prog, depends on how the
diskette was made (real Atari or emulator). A lot of the diskettes are made
for use with menu loaders, or autoboot and access other files on diskette...
so it is not so easy to convert them into just one file that will load.

http://www2.asw.cz/~kubecj/asoft.htm

Body handling: HTML body converted to readable text

The .DCM is processed usually with some degree of compression while the .ATR is a direct copy of all of the bytes from all of the sectors in order preceded by the 16 byte header specifying properties such as bytes per sector, etc.

The APE and SIO2PC software will write the data from the .ATR on the PC to a disk on the Atari. If you can transfer the .ATR, which is larger than 88K, to the A8 on a large Ramdisk or other higher capacity media then you could use my home made utility or several like it to write the disk.

5020. Re: Getting Rid of RFI?

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-28 17:16:49 UTC
From: Bob Woolley <ataribob@directvinternet.com>
Message-ID: <3d95e4d7$1_2@nopics.sjc>
Source record: 27193

I have found that the Atari seems to be designed to drive a 75 ohm video load, not an open circuit that most s-video inputs present. Anyway, the Atari overdrives the s-video inputs of many devices. Try shunting the video on the end of the s-video cable with 75 ohm resistors (or, 82 ohm, 100 ohms, even).

As far as toroids go, the power supply and such were filtered to keep the RF from radiating from the computer, not into the computer. You can thread the cable thru the toroid multiple times to increase filtering, if you think it helps. Most of the noise in the video is the result of ground bounce in the video circuits - very hard to fix.....

Bob

> What do you think?

One thing you can do is to build a small universal pre-amplifier with 3 (or 5) band equalizer. There should be kits out there
(like Vellemann or Kemo) with the PCB and the components, so you only have to solder everything together. Just remember you may
need two kits if they're mono ones, since you now have 2 audio-channels :-)

Yes. Like those things they sell at "Conrad Electronics".

Years ago I built such an amplifier (a mono one) for my 600XL that was built into my car. It was used to connect the Atari-audio
to my caraudio- amplifiers. I just took a standard pre-amplifier, but it didn't amplify enough so I added an extra small amplifier
in between the Atari and the pre-amp. Worked o.k, but I could only adjust high-and-low. A 3-band equalizer would be better I
think.

At home, I connected the Atari audio-output to one of the microphone-inputs of my audiomixer. Since this input amplifies a bit too
much I mounted a small potentiometer at the input to weaken the Atari-signal a bit. Works well.

Another option is to use a phono-amplifier. These things have built-in tone-correction to put more bass in the audio and drop the
high tones a bit (vinyl records are not recorded 1-on-1. They have lowered the bass-level). The Atari-signal will be a bit too
high for such very high impedance amp, but you can weaken it by adding an extra potentiometer for each channel.

Howdy *.*!

I'm planing to upgrade my xe to freddy offengas stereo deluxe upgrade.
Having stereo is just fine, but the pokey sound isn't very bouncing at
all. Even with a very bassfull hifi setup the music plays all time
very high-noisy and some kind of squeaky.

I've heard of several c64 filter-upgrades or sid audio enhancements.
But, at this moment, I can not find any of them in the net. But as a
matter of principle, there should be a way to use those c64 inventions
in our favourite computer, right??

What do you think?

Thanks Solar, my intent has always been to help all that I can and
offer some input into the group. Sadly the last few days have dented
my enjoyment of the group TOTALLY based on some totally silly nonsense
aimed at me.

Personally I don't know what the deal is but it's put me off using the
group for a while, I've never wanted to be 'in the limelight' I just
enjoy my old Atari and help with answers regarding Atari800win Plus
which I beta test.

To do this I need to enjoy the group and thanks to an individuals OTT
preoccupation with my posting my displeasure at getting an abusive
anon email which I was willing to forget I feel the need to clear off
for a while and let things calm down because I'm both pissed off with
the hassle and not enjoying the main thing the group is here
for..Atari.

Tis a shame how something so harmless as all this has been blown up
just because another person did not agree with my views.

Very sad....Very childish..

People who want to email me are more than welcome if it's in a
friendly manner.

I gotta say something.
Ben and Lance are fine with me. They participate
and really have a deep interest.
I remember when we used to get post after post
of ding-dang AUCTIONS in the group. Now that
bugged me.
E-bay came along and now all we get is to my
thinking useful links to someone's auction.
Bill Kendrick posted a FS, but that is also OK,
it was only one post of a very interesting piece.
Lemme see, can we turn this into something like
e-bay?
If someone prevents Ben's posts thru his ISP, I'd
get a new ISP, there's nothing spamming or abusive
about Ben's posts.

The Dormouse had a lot to say in "Alice In Wonderland". One example:

The Dormouse looked out, and he said with a sigh:
"I suppose all these people know better than I.
It was silly, perhaps, but I did like the view
Of geraniums (red) and delphiniums (blue)."

But as Fox-1 told me, this is not where he got the Dormouse saying....

Freddy.

If the SF is an ST drive, no.

There is no firmware in ST diskdrives. Basically the SF354 is only a bare IBM/Amiga-like mechanic in a case with a powersupply.
If the drive supports both 40 and 80 tracks (360KB/720KB) there is probably also an extra PCB in it to adjust the step-rate of the
mechanic. Typically, the mechanics do have a disk-change switch/sensor, which most IBM-types don't have.

> what says our technicans to this idea?

I'm not an ST-er, but I think I'm right, more or less, of the above :-) Those who have an Atari "HDI" diskdrive controller are
abe to connect the drive to it. I think it'll also work with the BlackBox FloppyBoard.

A hint for you:

You better enable the "quote original message" when sending a reply to a newsgroup. The old message will be inserted this way so
your postings make sense. Remember to delete the non-relevant stuff in the old message. If you mail like you do now, no one
knows to who or about what you are replying. People only see an answer without the question.

5052. New game in the works (MAYBE)

Newsgroup: comp.sys.atari.8bit
Date: 2002-09-29 22:24:55 UTC
From: bill@newbreedsoftware.com
Message-ID: <X4Ll9.32421$lk.695971@typhoon.sonic.net>
Source record: 27224

I'm considering doing a 'Puzzle-Bobble' (aka 'Bust-a-Move') clone for the Atari. There's a really nice one for Linux called 'Frozen-Bubble' (http://www.frozen-bubble.org/)

I think that with patience and my Action! reference nearby, I might just be able to do it. :^)

I'm going to do it in 'Super IRG' mode, like I did "Gem Drop."

I have some screenshots here:

http://www.sonic.net/~nbs/fbatari/

The JPEGs were taken with a digital camera. Unfortunately, the shutter speed is so fast that the 'flickering effect' (which works with human eyes, thanks to persistence of vision) didn't actually work, so it just looks all dithery. :^P

I just took a shot with Atari800 emulator, using the 'blend to frames into one screenshot' features ([Shift]+[F10]), and it worked well:

http://www.sonic.net/~nbs/fbatari/emu.gif

If you look closely, there are 13 colors in the picture. :^)

Of course, that's a little _better_ than it would look in real life, since it's blended perfectly. On an Atari, your eyes are doing this, so it looks a little flickery. (Just look at "Gem Drop" to get an idea. http://www.newbreedsoftware.com/gemdrop/)

Note: Since there's no palette tricks - just characterset flipping, it allows me to blend colors in a checkerboard pattern.

e.g., grey could be made out of black (.) and white (#) like so:

```
.#.#.#
#.#.#.
.#.#.#
#.#.#.
```

versus the typical way you need to do blending using something like APAC or ColorView modes:

```
#######
......
#######
......
```

So it's a LITTLE different from those. (Again, see Gem Drop :^))

To do the graphics, I'm using The GIMP under Linux. I created a reduced color palette based on all of the blends I'd get with the colors I picked. (Picked on the basis of needing them to get some useful blends :^))

The base colors are black, white, green, red and blue.

Since it's an IRG characterset, red and blue are actually the same pixel value (11), so I can't use them together within one character (4x8 grid), since which color I get (red or blue) depends on whether the character itself is in 'inverse' (high bit on).

So, I can't get purple. :^) But I can get yellow (red+green) and cyan (blue+green)... just not in the same 4x8 grid.

Once converted down to the appropriate palette, I run the image through a tiny and st00pid C program I wrote that reads the RGB values, decides which pixel the Atari wants (binary 00 for black, 01 for white, 10 for green, and 11 for red or blue), and throws them all together and saves them as a SIFE font. (Pretty much just two 1024-byte Atari character set descriptions glued together. See: http://www.newbreedsoftware.com/sife/)

There are some glitches, and I have no idea why yet, but I was working on this at about 3am last night. :^)

I'm also still trying to get used to using my Atari again (since I'm using the new SIO2PC software for Linux - but it has pretty much NO user interface yet. :^))

Anyway - Wish me luck. Between preparing for my wedding
(oh yeah, I'm getting married (FINALLY) this October - close to the heels of both Itay Chamiel and Nir Dary, apparently!), working full time (WorldCom, if you didn't know), and working on a cool program for Linux (see page 62 of this month's Linux Journal!
Or just go here: http://www.newbreedsoftware.com/tuxpaint/
It's for Windows, too :^)), I'm not sure how quickly I'll get this done. :^)

From what I remember both those models were developed but very few are known to exist. I've seen 1 of each about a decade ago. I wouldn't call them "non-existant" but the certainly do qualify as rare.

I dunno if the europe only release is 100% accurate. I've seen a few in canada in user group flea markets and once or twice in dealers in the first half of the 80's. I've also seen the same printer with a standard centronics interface under the label of "Gorilla" I think it was. I remember hearing (in a mag in the 80's) that the printer engine was sold to several companies to be marketed under their own name.

For the ST drives like the sf354 you'd need to design a disk interface to use it on an 8bit. There were 2 drives similar to this specifically for the 8bit, one was a prototype XF series drive, unfortunately it wasnt in mass production, it would be very uncommon to say the least. I've only seen the photos of it in the best electronics catalogue. The other was actually a modification to a standard XF551 which would allow the use of a 720k 3.5 inch drive. I think it was Bob Wooley who first came up with this modification so he'd be able to describe how it worked better than I would since I never had one.

Howdy *.*!

According to the articel at http://www.atari-history.com/ , the xf-351
is very similar to the sf-354 .. is that true? Is it possible to
change the firmware (just like the xf551) and use this drive as a
8-bit line floppy??

Of course, there should a changed port for sio support, but I think,
it's not impossible to bring up some very durable and reliable floppy
disks to the xl/xe.

what says our technicans to this idea?

Really? The guy I purchased it from had this to say:

>
> > Imagic games ATlantis and DEmon Attacks will not work on anything but a
> > straight 400 or 800 machine. XL and XE machines cannot play Imagic
> > carts.

I also got a reply from another guy who said this:

> we have a translator cartridge that can cure that. you will find it on
> our web pages at,
> www.atarisales.com
> i play demon attack on my xe all of the time.

I probably won't spend $20 to get the translator for one cart, but I want to know for sure whether this cart should have worked before I give it away (I do have a guy interested).

Thanks
James

I'm starting to use my Atari 800xl again after a number of years (including xl emulation), and I'd like to know what are considered the premier DOS, BASIC, and assembler programs that are floating around out there these days. From what I can tell, there are a number of each, so I'd appreciate opinions on what to start with.

Thanks
James

There are two that are popular, MyDOS and Sparta DOS. Both are available freeware/shareware. MyDOS has a menu system like Atari DOS II while Sparta DOS uses a command line or loads an unfamiliar menu system from disk.
> BASIC, and assembler programs that are floating around out there these days.

Many consider OSS languages to be the best, but they are not readily available and if you do find them, they are quite expensive.

Turbo Basic is quite good. From a speed and ease of use standpoint many prefer it.

Personally I prefer not to run either. If I am<was> programming in BASIC I would just use built in BASIC and write assembly language subroutines to get the program speed up. It is a lowest common demoninator type thing.

For an assembler the disk based version of MAC/65 is included in the Sparta DOS distribution. You will probably never need a better assembler then MAC/65. It is a matter of tastes since I have run into people that prefer the Atari Macro Assembler and John Harris wrote MAE to facilitate development with a 65816 machine he was coding for. At one time I even used TASM cross assembler from Speech Technology over anything on an Atari. Even on a '286 the speed and 80 column screen was so much better then an Atari that it made a viable development system. I think TASM is considered obsolete now with all the Windows based cross assemblers out.

Deep Blue C compiler.
ACE C compiler (based on DBC).
CC8 (based on DBC and ACE).
CC65.

Those are what I found on XL Search, at least. :^)

I believe the first three create some kind of bytecode that needs a runtime.

I never got into C on the Atari, though. I always stuck to Action! :^/

Good luck!

>As a followup, are there any Atari-native C compilers?

If you are interested in programming in C for the Atari, I think your best bet is to use a cross-compiler like cc65 (www.cc65.org) so you can take advantage of the speed of the PC for development. Combined with Atari800win+ you can code applications pretty quickly.

I think that there is an older, native version of cc65 that runs on the atari but I don't believe that it is being actively supported anymore... never tried to use it.

If you are interested in C for the atari check out cc65! It's great and being actively supported and developed!

It's not a permanent solution. :) Just an option.

I've a decent computer, but I want a computer to use as a dedicated
sequencer, then maybe couple my better computer to do more complex blocks,
and have rackmount/MIDIfied equipment to use for dedicated purposes. Just
for somehting different to do. :)

If I wanna get primitive, I can, but I don't necessarily have to. :)

5089. Modem R: device handlers

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-01 03:15:36 UTC
From: Michael Current <mcurrent@carleton.edu>
Message-ID: <mcurrent-0A0753.22153630092002@news.supernews.com>
Source record: 27108

Freshly written for the FAQ, critiques please??

=-=-=-=-=

Subject: 7.8) What should I know about modem device handlers?

In order to use a modem on the Atari, a modem software handler, or R: device handler, must be loaded into memory.

There are several families of R: handlers, corresponding to the different ways in which a modem may be attached to the Atari:

1) 835/1030/XM301 modems. Atari-only modems, interface via SIO
2) MPP/Supra modems. Atari-only modems, interface via joystick port
3) R-Verter cable. Connect standard Hayes-type modems via SIO
/ SX212 modem. A Hayes-compatible modem, interface via SIO

These first three types of software handlers are used in one of two ways. Either they are (A) loaded into memory from DOS just before running the main terminal application, or (B) the terminal program is appended to the handler, so that in practice, a single file is loaded from DOS which contains both the R: device handler and the application itself.

4) 850/P:R: Connection, internal

This type of "mini handler" simply loads the R: device handler code from a ROM chip inside the RS232 serial interface. A long beep is heard through the speaker when the handler is loaded into the computer's RAM.

Many varieties of DOS for the Atari include an explicit provision for loading this type of R: handler into memory from the 850 or compatible interface.

Also, this type of R: handler is automatically loaded when any 8-bit Atari computer is turned on with a P:R: Connection or powered 850 connected, but no powered disk drive is present.

5) 850/P:R: Connection, external

Like types #1-#3, but used with the 850/P:R: Connection in place of these interfaces' built-in handlers.

6) MIO/Black Box, internal

These interfaces utilitize the PBI or ECI parallel ports on the Atari. They include their own R: handlers in ROM, using no computer RAM at all.

7) MIO/Black Box, external: Len Spencer's Hyperspeed

This handler is "optional" for the Black Box, but "essential" for the MIO
in order to take full advantage of the high-speed hardware handshaking
capabilities of these two interfaces.

Hyperspd.arc is available at http://members.aol.com/lenspencer/atari8.htm

Some variations of the 850 existed. For example, I've here an interface
box called the "850 XL" manufactored by a thrid party company in Germany.
The 850XL is a plain 850 design with one serial port instead of four, but an
enhanced printer driver "P:" that was able to translate the Atari specific
graphic characters by Epson "Esc-P" specific line printer graphics, i.e. it
would automatically print graphics to represent these characters. Additionally,
the translation of EOL to LF could be enabled/disabled by software. The
usage of the R: driver is similar to that of the 850, it is booted off the
internal ROM of the 850XL in exactly the same way. Some third-party handlers
exist that bypass this bootstrap process and handle the 850(XL) directly with
a disk-resident handler (instead of a 850-ROM resident handler).

So long,
Thomas

I like BeWe DOS, which is a command line DOS along the lines of Sparta DOS except it will also run on an Atari 800. So, it is more of a "Sparta DOS Lite." I would have to say that BASIC XL is considered the premiere BASIC. You can also find some freely distributable BASICs on the Internet. I think I recall that Frost BASIC was a good one. Don't know anything about assembler programs, except that the official Atari Assembler Editor package is not very good or user friendly..

For all the morons protecting little Benny, sing along with this Queen song....

Benny you're a boy make a big noise
Playin' on the net gonna be a big man some day
You got mud on yo' face
But just in case
Postin' your ads all over the place
Singin'

We will we will block you
We will we will block you

Benny you're a young man hard man
Shoutin' in the group gonna wipe out the auctions some day
You got blood on yo' face
You big disgrace
Wavin' your hyperlink all over the place
Singin'

He will he will spam you
He will he will spam you

Benny you're an old man poor man
Pleadin' with your eyes gonna make you some peace some day
You got mud on your face
You big disgrace
Somebody better put you back in your place

We will we will block you
We will we will block you

I'm using an emulator (XFORMER for DOS; but my question applies to the other emulators out there:

I've downloaded, say, a program from UMICH archives (in ARC format), how do I read it in these emulators and / or copy to DCM or XFD format ? Make sense ?

The answer is simple. Not... ARC is not an image-format but an archiver-format. You need to depack the file (like UnZIP) in
prior to be able to use it. For MS-Dos, try the one at my site:
http://www7.brinkster.com/atari/pcdl/pcutil.htm#top

PKXARC.ZIP is the one you want. As you see, it is ZIPped, but I can't imagine a PC user who can't UnZIP files...

But BeWe-Dos is also a DOS which does only support up to 4 diskdrives/partitions at once (plus a ramdisk)

b.t.w, I think there isn't any serious bug in the 3.3 versions of Sparta-Dos...

Read it as a file (I don't know if XFormer can, but Atari800 can, at
least with the "H:" drive simulation), copy it into a disk image, and
then unARC it there.

Or, just get an unARC program for your PC!

-bill!

During the development of BW-DOS, the author (Jiri) found several bugs in SpartaDOS. In fact he told me these bugs are so serious, that even he didn't want to use SpartaDOS anymore. It could be that SpartaDOS X doesn't have the serious problems, but at least the disk versions are not ok.

Freddy.

On Atari-meetings, I spoke with Jiri a few times. Unfortunately, his English is not that perfect (as is mine, but much better then
I can talk Czech :-)) and he refers to the 2.3 and 3.2 Sparta-Dos versions. Many things he calls "bugs" are actually
"incompatibilities". One major bug was the file-open/close one, introduced in Sparta-Dos 3.2f (3.2d?) which the 3.3 versions don't
have.

He didn't had the 3.3 versions right then, nor he had Sparta-Dos X. The last time we met (Atariada 2001) I gave him copies of 3.3a
and 3.3b. Don't know if he's gonna use them or not. Probably not since BeWe-Dos is pretty much unsupported right now, but things
may change in the future...

Besides this, I also made a copy of ATOS for him. If he can find the time, he'll test it a bit with BeWe-Dos, but he had to finish
his harddisk set-up first.

2 options:

1) F11 to the configure menu
assign your file with complete path to any drive
assign your .XFD to another drive
use Dos to copy the file to the .XFD
(avoid wildcards and specify full A8 filename as shown by a directory)

2) Unarc the file on the PC
follow step 1 for moving file to an image.

i have read all i can find on using the joyports as I/O ports in general. the best article i've yet read is called something like " halloween and robotics on an atari 800".. something like that. google seems too not know it but metacrawler does. anyway i have set up the grid of led's 16 in a 4 by 4 grid and can program them as i please. what i want to know is can i set it up so i can plug in port to port and set the proper pin configuration and send the 1's and 0's directly. on an 800 using the portb set of plugs i can use a simple phototransitor/reciever but is this overkill. what are the complications of hooking them straight(if possible). i have seen all types of ideas and have on a cd somewhere a deal from i think rick 8 ball that uses 3 pins or something. id there a quick way to sum up the idea of plug for plug joyport communication.

Dear Atarians,

Can anyone recommend an easy-to-use BBS software package for the Atari 8-bit system. Although there is a considerable commitment of time and effort in runing even a small part-time BBS, I have been playing with the idea of starting a new 8-bit service. Thank you!

Sincerely, An Atarian Forever...

Ok, probably the 3.3 versions don't have the serious problems (not sure). I just wanted to point out that I would choose for BW-DOS above Sparta. That's all. ;-)

Freddy.

Just got the disk version of this game.

It includes an A4 black/white (bad copy) of a 'would-be' manual.
Doesn't look like an original manual to me. Anyone has this game?

Also, the label on the disk is a very small white label containing only
printed "whomper stomper".
Can someone confirm this is an original? Thanks.

Freddy.

I vote for BBS Express Professional since it has virtually no limits. It's not a free package. Visit "video61" for more info:

BeWe-Dos is without a doubt a great DOS. The fact it doesn't use RAM under the O.S. is a great advantage when using TurboBasic.
At the time I bought my blackbox' and started to use big partitions on harddisks, BeWe-DOS was not developed yet, and I absolutely
didn't like MyDos, since it was menu-driven (before I used Turbo-DOS and DOS 2.5 with the Chaos CMD-line processor since I don't
like menu's at all :-))
So I had to make a choice: using Sparta-Dos and go back to standard BASIC, or learning to like menu's and keep using Turbo-BASIC.

It turned out into learning myself some bits of 6502 assembly while dropping all flavours of BASIC :-)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Dear Atarians,

I was at the Atari Game Night in Portland, Oregon and it was great! Ben Smith and others brought out some classic games and we played for hours. It is so very true; Atari 8-bit games are as fun and exciting today as they were when first released all those years ago. If anyone is interested in attending the next Game Night please contact Ben Smith.

Sincerely, An Atarian Forever...

H&#65533; Fox-1,

I switched from Black-box to SIO2PC years ago and still find it perfect for what I'm doing. I actually never traded DOS 2.5 (and compatibles) for Sparta because of the incompatibility. Many disks use the DOS 2.5 format and there's nothing wrong with that. I like TurboDOS and dislike MyDOS.

Turbo BASIC is great for prototyping and utility programs. For the rest, asm rules ofcourse! :-)

<IMHO>
I know there are a lot here using HD's with all kinds of interfaces and I'm sure there are reasons to use them. Still, when you think about it, it seems a little silly to remove a harddisk from an old PC, install it in (or next to) an Atari and keep the rest of the PC unused. With SIO2PC you can use the HD, monitor everything, have a R: and P: interface and more. Some say, speed is the problem, but then there should be simply a faster connection between the A8 and PC (extra PIA comes to mind).
</IMHO>

Best,
Freddy.

hi freddy,
many of adventure international releases had the badly photo-copied
manuals, and the little white stickers on the disk, so yours sounds
legit.
have fun with the game, its cool!, its so cool we put the game onto a
cart.
we have the rights to do all of his games on cart,
thanks,

Mine originally came with a driver program; and, I believe, a basic program to
set up the driver from BASIC. Later they shipped with a special version of
MyDOS with the R: handler built in. My memory is a little fuzzy on details.
I haven't been using my system in quite a while.

Drive:What is the malfunction? Causes can be..dirty head or sensor, drive belt came off, bent SIO pin or bad cable, loose chips, power supply.

If you have a working Atari cassette, then there are several cassette to disk programs. Probably at Umich and other ssites. Some commercial games are too complicated to transfer to disk.

I use a null modem setup to transfer files between the A8 and the other computers..ST, pc laptop, and desktop. 9600 baud with an 850.

There is an ATR-8000 specific RS232 driver, always bundled with the R:
versions of Mydos. Should work with other versions of DOS. The ATR-8500
had a different driver.

There was a way it could be used with the 850 driver to provide 5 R:ports.

In order to find where the section is that you need to make the change, you have to have an idea of what is happening at that point. Locate where all occurances of the value is in the listing. Then you have to start searching those areas of the code, disassembling it to find out what it does. Lots of work. But doable. Always have several safe backups! This is how I fixed a problem with directories in Speedscript.

It may also be possible to run an ml monitor on the Z80 device so that it will show you on screen what the code is doing and where. Emulators may work, and can help in debugging the change.

hey atari,

i think the idea of using the flash card pic chip deal is the best option out of all the current data saveing solutions. i do not think it is even arguable. but so much has been put in these other ide and mechanical solutions. he who can produce one should do it. cheap. comparatively simple. and convenient. like a cartridge disk drive. i just wonder why a wall wart would be needed. it is the best solution period.

5146. Need to know game name

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-03 06:57:40 UTC
From: jirinej@volny.cz
Message-ID: <7e29a94a.0210022257.88a60a9@posting.google.com>
Source record: 27017

Many years ago I had a game on my 800 XL, now I dont't remember its name. It was simple, very fast shooter, your spaceship was at the bottom of the screen and can move only left/right (something like Alien Ambush, but much faster) . From above descended various sets of aliens (something like in Gyruss). One set, as far as I remember, was something like butterflies. The shooting was pretty fast, and the sound of shooting was also good. It was one of a few games, in which I used autofire. Does somebody remember its name ? Thanks.

Yeah. That's what I thought of. Anyways I hoped for something like:

- Epson xx-yyy (fits also MPS-801, Atari 1029, etc. etc.)

I simply hoped that the engine was made by a well-known printer brand
and licensed to others but which one?

Oh yeah, I see from Michael's faq that it was SEIKO who did it. Just
which model(s) it was used in is still open.

5154. XF551 drive mechanism

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-03 14:21:52 UTC
From: Freddy Offenga <taf.offenga@chello.nl>
Message-ID: <4oYm9.1416565$oa7.49176882@Flipper>
Source record: 27025

One of my XF551 drive mech. is broken (a mitsumi).
The mechanism was used with my Floppy Board for years, but now it only
produces 'boot error'.
I've tried some other 5.25 mechanism which do work, but don't fit in the
XF551 case. :-(

Any suggestions of how to fix it?

Freddy.

I think its a SEIKOSHA GP500, but not 100% sure. However, the
Commodore MPS-801 ribbons should be much easier to find.

Is this being used in an XF551 or a Floppy Board? Many of the older 5 1/4 drives draw too much power to be used in an XF551. If it is on a FB, you should just mount it in a 1050 case or something and power it externally or pull the guts out of the XF551 and power that externally. This is going to get worse as time goes by... These old drives are not going to last forever. You can fix the drive, but you need parts -- which you can only get from another drive. Do you have any idea what is wrong with it? Does it spin, seek and such? Will it read at all? Try pushing gently on the head carriage while it tries to read - maybe it is just out of alignment a little (wishful thinking...).

hi,

I remember reading an atari mag back few years ago (not sure which mag) that interviewed one of the 8-bit atari designers comparing the atari vs. an apple IIe/c.

does anyone remember such an article? which mag it was and if someone would be willing to post a scan of the article?

for some reason, I remember reading this article many many years ago and would really like to read it again.

thanks a bunch,
thomas

5165. Fractal 3D programm in BASIC from German magazine

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-03 21:42:58 UTC
From: Christopher Lang <christopher.lang@plus.cablesurf.de>
Message-ID: <anidndftk1@nntp.gatel.net>
Source record: 27036

I remember a fractal 3D mandelbrot programm from a German magazine. The nice thing about that fractal programm was that it displayed the mandelbrot landscape in 3D and they used a little trick to make it look like as if the light comes from one side. If you had your machine running overnight you got some really nice 3D mandelbrot landscapes on your screen.

To bad that I lost the disk with the programm on it.

I would be grateful to anyone who knows the magazine, issue etc or who would be able to point me in some direction. Maybe the basic program is somewhere on the internet.

many thanks
Chris

Oasis and BBS Express are probably the most talked about. Do remember that the baud rates are generally going to keep to around 2400 baud unless you've hacked and patched the software. Nice thing is that you could run it using an emulator and allow incoming connections from the internet.

Have fun!

- Shangrila

A 3,5" mechanic would be an option, but is of no use when you already have some 5,25" laying around :-)

What is the problem a standard IBM-style does not fit? If it is the flatcable, you can extend it by gently removing the original
one from the XF PCB and replace it with a longer one. I did the same when mounting my XF PCB into a 1050 case with both a 5,25"
and a 3,5" mechanic.

If it was loading "levels" from disk, it may be "Bandits"...

> on the internet.

I don't know if we are thinking of the same program, but IIRC once there
was such a program in one of the "Happy Computer" magazines.

I searched my archive, but only found a compiled version of this
program (I guess I was bored from waiting so I used the TurboBasic
Compiler to speed things a little bit up).

First you are asked to enter your coordinates (x, y, and height), a
viewing direction and a filename, then the program starts drawing
some "clouds in the sky" and then starts with the 3D-landscape
(approx. in the bottom half of the screen).

If you like, I could email you the compiled program - just drop me
a line. I'm sure I got the original magazine with the source code
somewhere "archived" at my parents' home. If you don't succeed in
finding the program (and in case we are meaning the same program),
I can try to dig it out of my archive (but it could take a few weeks
before get there).

so long,

Hias

I'm a registered owner of APE for DOS and use it next to my blackbox'. APE runs on an old 486 under MS-Dos, connected to my
home-network. Works very well, but I use APE to transfer files between my PC's and Atari. When it comes to speed, working with a
black-box is much more fun.

In the past I also used APE to transfer data between my two Atari-with-Blackbox set-ups. Just created a temporary ATR image and
used it as a buffer. Unfortunately doing it this way is slow, but now I also have a SIO2IDE interface which makes some things
easier.

Besides of that, I hope to have some MUX-carts too in the very near future. Even more faster (At least I hope, never worked with a
MUX before).

> I actually never traded DOS 2.5 (and compatibles) for Sparta
> because of the incompatibility.

As for file-based programs, I use Sparta-Dos. If it doesn't run with Sparta-Dos, I simply don't use it.
If a disk is a kind of autobooting DOS 2.5 disk, it's o.k. for me as long as it acts like it is a bootdisk.
If there are utils on such a disk which needs to save data to a disk, I always try to replace the DOS with a version which is able
to use at least double-density, and when possible also quad-density. Usually it turns out that XDOS will be used for this, or
sometimes also TurboDos...

> Turbo BASIC is great for prototyping and utility programs. For the rest, asm

I've replaced a couple and had no troubles once I swaped out the mitsumi's drive rails for the ones on the replacement drive. Its not something really easy like that is it? I don't think you'll ever find a replacement drive that will have the XF-551 rails already attached, nor the XF-551 rails themselves anywhere. I set the BIOS on my PC to 360k drive and look for 'floppy fail (40)' error which means its a 1.2 meg or a bad drive to test prospective drives for XF-551 replacements.

Keep looking, there are lots of those drives that will fit once you use the right rails on them.

Hi.

I decided to invest in my 130 XE again - this is true love, isnï¿½t it?

Anyway: Iï¿½m searching for the version of AtariWriter for the XEP-80.
Itï¿½s called AtariWriter 80, I guess. Would need the disk for my XF551.

Iï¿½m also searching for someone who can put an ide-controller plus a
2.5"-harddisc into this little machine, because Iï¿½m too foolish for
that. System should boot from the harddisc.
If a memory upgrade (1 MB) would be installed also, Iï¿½d be most happy.
:)

Feel free to contact me (especially from Germany and/or Europe). Iï¿½d
certainly be willing to pay for your work and software and prefer
original software.

Take care,

Much like Lance owning BBS Express Pro, I don't think you're going to find anything except Oasis Jr. for download. I might be mistaken but I don't believe the more current Oasis versions to be in the public domain. It's been ages since I've played around with Oasis but I'd say it's another great piece of BBS software.

Good luck in your search!

5180. Best disk copy program for the Atari?

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-04 09:08:31 UTC
From: dunxuk@aol.com
Message-ID: <20021004050831.10611.00011890@mb-cu.aol.com>
Source record: 27051

What is the best program for copying Atari disks? I use diskcomm 3.2 at the moment to create perfect disks from DCM files (bad sectors and all) but I now have an SIO2PC cable and would like to copy from an ATR image on the PC to a normal Atari floppy. Also does anyone else find that diskcomm doesn't like writing to a normal drive when there is an SIO2PC cable in the daisy somewhere?

Many thanks!

BTW;

I'm not trying to plug an Atari disk drive into the PC.
I'm not going to buy an 10502PC cable.
I'm not just going to run them from the PC and not bother with floppies.
I think that covers it!! :o)

Ok, Bob, I didn't check all the things you mention. Just slipped in another drive and since it worked concluded that the other one is bad.

The bad drive originally came from that same XF551 case, but I used it with the FB for some time.
It could even be that the drive was already bad when used with the FB, since I also had troubles with it then.

Will try the 'alignment' check.

Thanks for the info!

Freddy.

P.S. The working drive makes quite some noise when the head moves. I remember we used to solve it with the 1050 using a little oil. Is it save to do this?

H&#65533; Fox-1,

I like to use the drive to preserve my 5.25 disks, so the 3.5 is of no use
to me.
Everything would fit if the drives I have weren't such long ones. I guess
the more modern 5.25 drives are no problem. A black front would be good,
since the XF551 case is black too. :-)

So who owns the rights to OASIS, and where is it available for sale?

(the FAQ and Vendors Lists want to know :)

-Michael

Well, I think yours must have been somewhere down... ;-) I spent some
time searching for schematics and pinouts, and the results were
inconsistent. Some were referring to the chroma being NC, some
differently. Also audio was not consistently shown.

Thanks anyway.

Wondering if there are any chances for getting the Service Manual, or at
least schematics for the 1050?

Source record: 27063

Well,
and me I gave him a harddisk plus My-IDE interface for free. He told me
that he hasn`t found the time lately to test or use it. Besides I also
asked Jiri if he could patch Bewe-DOS for use with a) up to 8 (or 9)
drives and b) up to 1440kbytes (disk) and up to 16 Megabytes (harddisk).
Of course all the Bewe utilities (like Format.COM, Menu.Com, etc.)
should then be patched also for the new options. Unfortunately he told
me that he neither has the time nor the motivation to do so. And if he
would, he would soon have problems keeping the memlo under $2000...
Well, looks like we have to live with the latest Bewe-DOS version 1.3.
-Andreas.

P.S.: We can buy almost everything, except TIME (or another LIFE)...

Message-ID: <3D9DC5AB.2641E7BE@students.uni-mainz.de>
Source record: 27064

Well,
looks like the version I had of Whomper Stomper (before I gave it away).
There are many other commercial games that have very simple manuals or
labels. For example I remember "Asylum" which had a golden/metal
disk-label - but nothing was printed on it (still the disk was copy
protected and I had the original manual+package)... -Andreas.

Hmmm,
sounds like "Atari magazin" or maybe "Zong". I don`t know where to find
the basic programs on the internet - but e-Mail me and I will send you a
copy of them. (AM contains a Basic program, a later issue also had the
TB program; Zong contains some TB programs by Thimo Graef...)
-Andreas.

5195. Ramdisk info (Version 2.0)

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-04 17:06:38 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3D9DCA9E.4BD888A7@students.uni-mainz.de>
Source record: 27066

Hello folks,
below is the new(est) version of my Ramdisk info-article. I made a few
updates like:
- shortened the whole article (removed some paragraphs)
- (hopefully) limited the whole text to a max. of 76 chars. per line
(checked it with Word 6.0 and it looks like it works alright now!)
- updated the info for AM ramdisk (Basic on / off - Rambanks)
- maybe more (I don`t remember)...
greetings, Andreas.

----------snip
here----------

3.7 Atari Ramdisks - the first try of an (incomplete) Overview:
[This is version 2.0 from October 2002]

Right from the start of the Atari 8-bit computer era in the late
70`s,
Atari users wanted to have as much RAM as possible (or as their purse
could afford). Having a 16k machine with a tape device was nice and
cheap, but having full 48k or 64k and a floppy drive was much nicer
(and very expensive). Thus many Atari users began to create selfmade
RAM
extensions and enhancements, just to save some money. Also a lot of
firms
provided extra RAM, RAM enhancements, RAM extensions and Ramdisks.
Besides Atari there were (and still are) quite a lot of producers,
manufacturers, distributors and authors of such RAM enhancements...

This "short" and incomplete overview does not provide any docs or
manuals,
but gives some info about the various Ramdisks on the market. Since
these
notes are written by me, they will merely contain the information I
have.
And as you all can see - it isn`t much information. So any help and
extra
info, as well as corrections, are very welcome. It would be nice to
see
this text & info growing. For now let us start here, the info-section
is
divided into 8 groups:

1) Name (Name of the RD, e.g. Megaram 2 or Rambo XL or MIO, etc.);
2) Vendor/Author (or distributor, manufacturer, producer, etc.);
3) Size (size of the Ramdisk only; NOT the full computer memory);

4) [Bankswitching] Area (for XL/XE computers usually 4000-7FFF);
5) Banks (hexadecimal input count, as in MyDOS or RAMDTEST.BIN);
6) Control Bits (which bits are used to control the Rambanks);
7) Port (control Port - usually Port B for XL/XE machines);
8) Notes (any extra info, comments, miscelleanous things, etc.);

If you wish to add any other type of info, let me know. The above
information should be enough for most programmers to support a RD in
their programs (especially to support more than just one type of RD).
Hopefully future programs will take care about this info or just use
a small setup program to setup any kind of RD. Now let me begin:

A) Atari 400/800 Ramdisks:

Name Vendor Size Area
Banks Bits Port Notes

- Axlon Axlon/Atari 64k 4000-7FFF
0 thru 3 0,1 (CFFF) plug-in-board
Note: total memory = 96kbytes (32k RAM + 64k RD);

- Axlon Axlon/Atari 128k 4000-7FFF
0 thru 7 0,1,2 (CFFF) plug-in-board
Note: total memory = 160kbytes (32k RAM + 128k RD);

- 288k800 D.Byrd and others 256k 4000-7FFF
0 thru 15 0,1,2,3 (CFFF) selfmade-board
Note: total memory = 288kbytes, Axlon compatible;

- 544k800 various authors 512k 4000-7FFF
0 thru 31 0,1,2,3,4 (CFFF) selfmade-board
Note: total memory = 544kbytes, Axlon compatible;

- 1056k800 various authors 1024k 4000-7FFF
0 thru 63 0,1,2,3,4,5 (CFFF) selfmade-board
Note: total memory = 1056kbytes, Axlon compatible;

- 2080k800 various authors 2048k 4000-7FFF
0 thru 127 0,1,2,3,4,5,6 (CFFF) selfmade-board
Note: total memory = 2080kbytes, Axlon compatible;

- 4128k800 various authors 4096k 4000-7FFF
0 thru 255 0,1,2,3,4,5,6,7 (CFFF) selfmade-board
Note: total memory = 4128kbytes, Axlon compatible;

=> Note that all so-called Axlon "compatible" (256k-4096k) Ramdisks
normally do not homebank when RESET is pressed (a fix should be
available somewhere), whereas original Axlon Ramdisks do homebank
properly !! (Special thanks to Lee Barnes for this note !!)

- Mosaic RAMpower by Mosaic Electronics is actually a Ramboard, that
enhances the memory of your Atari 800; avaiable in 3 sizes: 16k,

32k and 64k (where max. 52k can be utilized from 64k). Looks like
these are no Ramdisks, just (normal/main) RAM enhancements. But
maybe
the 64k Ramboard can be patched in some way to gain a small 16k or
32k Ramdisk (48k RAM + 16k RD or 32k RAM + 32k RD) ?!?

- ...

B) Atari XL/XE Ramdisks:

Name Vendor Size
Area Bits Port
Banks
Notes

=> Note that bit 4 is always used in all Port B type memory upgrades to
turn on the CPU's access to the extended memory. Thus, it is not
reported
in bit use tables as a used bit as it does not control which bank gets
switched into the 4000-7FFF region. This seems to be a standard
convention
as the majority of ramdisk users don't want bit 4 counted as a control
bit.
And it's not a control bit - its the 'on' bit. Likewise, bit 5 is the
'on'
bit for ANTIC's access to the extended memory for 'compatible' (to
130XE)
machines as well. If bit 5 does show up in a bit use table, one can
only
assume that this is an incompatible machine which doesn't have or use
ANTIC
access at all. In that special case, bit 5 is then available for use
in
switching in the various banks and thus gets counted as a control bit
in
bit use tables. (Special thanks to Lee Barnes for this note !!)

- 130XE-Ramdisk Atari 64k
4000-7FFF 2,3 B ($D301)
Banks: E3,E7,EB,EF;
Notes: old=8kbyte chips (west), new=32kbyte chips (east);
XE`s made in China have faulty GTIAs => replace them!;
XE`s and XEGS made in China also have a new OS which causes
some incompatibility problems (try: Encounter / disk version
by Novagen or try: Falcon-Demo by Hurek, etc.); just replace
the new OS with an older XL/XE one if you want less trouble!;
standard Atari RD - available with all XE-compatible ramdisks;
Antic access: YES! Atari Basic: YES! XL/XE Selftest: YES!;

- 576k XL various authors 512k
4000-7FFF 2,3,4,5,6,7 B ($D301)
Banks: ef,eb,e7,e3,cf,cb,c7,c3
af,ab,a7,a3,8f,8b,87,83
6f,6b,67,63,4f,4b,47,43
2f,2b,27,23,0f,0b,07,03
Notes: This 512k upgrade is not the same as the one thats on the
British Underground. That one dont work, I had to fix it years ago.
It now 100% stable works with all Dos'es and fixes the 10 second
delay when rebooting. (I will publish the fix soon - Guy Ferrante)
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no (?)

- A.M. Ramdisk Atari Magazin 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 81,85,89,8D,A1,A5,A9,AD,C1,C5,C9,CD,E1,E5,E9,ED (Basic on!);
83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF (Basic off!);
Notes: manual and schematics, as well as a parts list can be found
in german Atari Magazin 2/1987 (includes a Basic test program!);
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Bob Woolley`s Atari 1200XL 1MB upgrade 960k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: EF, ED, EB, E9, E7, E5, E3, E1
CF, CD, CB, C9, C7, C5, C3, C1
AF, AD, AB, A9, A7, A5, A3, A1
8F, 8D, 8B, 89, 87, 85, 83, 81
4F, 4D, 4B, 49, 47, 45, 43, 41
2F, 2D, 2B, 29, 27, 25, 23, 21
0F, 0D, 0B, 09, 07, 05, 03, 01
Notes: this upgrade uses 64k as main RAM and 960k as Ramdisk;
Selftest: Yes!, Basic: "no" (1200XLs don`t have Basic built-in!);
Antic access: no! (can be upgraded to 1088k / 64k RAM + 1024k RD);

- Mathy`s RD M.v.Nisselroy 1024k
4000-7FFF 0,1,2,3,6,7 B ($D301)
Banks: EF EE ED EC EB EA E9 E8 E7 E6 E5 E4 E3 E2 E1 E0
AF AE AD AC AB AA A9 A8 A7 A6 A5 A4 A3 A2 A1 A0
6F 6E 6D 6C 6B 6A 69 68 67 66 65 64 63 62 61 60
2F 2E 2D 2C 2B 2A 29 28 27 26 25 24 23 22 21 20
Notes: uses a PC-SIMM (30-Pin-SIMM), pin-switching in RD: 4,5;
XL/XE/XEGS: Selftest+Basic=YES, XEGS: Missile Command=YES!;
no use of any switches!; Antic access: YES!; (CS-compatible!);

- Megaram 1 Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 16kbyte Chips x16 (very big/huge pcb);
originally designed (and maybe produced?) by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 2 Compyshop 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;

Notes: uses 64kbyte Chips x4 (much smaller pcb);
originally designed (and maybe produced?) by Ralf David,
newer Compyshop version; fully compatible to Megaram 1;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 K. Peters 256k
4000-7FFF 2,3,6,7 B ($D301)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 256kx4 Chips (514256-70); fully compatible to
Compyshop`s Megaram 1+2; originally designed by Ralf David;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Megaram 3 K. Peters 1024k
4000-7FFF 2,3,6,7 B ($D301)
0,1 (or switches) B ($D600)
Banks: 23,27,2B,2F,63,67,6B,6F,A3,A7,AB,AF,E3,E7,EB,EF;
Notes: uses 1Mx4 Chips (514400-70); can be a) 1 Ramdisk of 1 Mb
or b) 2 Ramdisks of 512kb each or c) 4 Ramdisks of 256kb each;
uses four (or more?) switches; 1MB mode is very incompatible!!;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

=> Note that most (if not all) Megaram-Ramdisks (Megaram 1, 2, 3)
have Refresh bugs/problems which can be solved quite easily
with one "AND Gate" (refer to ABBUC magazine 63, pages 19+20);

- Newell Newell Ind. 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: a) older version: 83,87,8B,8F,C3,C7,CB,CF,E3,E7,EB,EF;
b) newer version: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: uses 64k as main RAM and 192k as Ramdisk/extra RAM;
the older 256k Newell version was not compatible to Rambo XL,
Buchholz and Peterson, since these were not available then;
Newell was earlier on the market than Rambo and Peterson,
while early Buchholz Ramdisks used 32k banks instead of 16k
banks; all this changed with the appearance of the 130XE
and thus Buchholz designed 16k Rambanks and finally Newell
256k Ramdisks became Buchholz/RamboXL/Peterson compatible !!
Atari Basic: YES! XL/XE Selftest: YES! Antic access: YES!

- Newell Newell Ind. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F
41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-80), if full 1MB is used,
then built-in Atari Basic is not avaiable (insert the cart!);
Atari Basic: no! XL/XE Selftest: YES! Antic access: YES!

- Newell Patch by E.P. 1024k
4000-7FFF 1,2,3,5,6,7 B ($D301)
Banks: 01,03,05,07,09,0B,0D,0F,21,23,25,27,29,2B,2D,2F

41,43,45,47,49,4B,4D,4F,61,63,65,67,69,6B,6D,6F
81,83,85,87,89,8B,8D,8F,A1,A3,A5,A7,A9,AB,AD,AF
C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: uses 8 pc. 1Mx1 Chips (511000-80), modified by Erhard
Puetz (refer to ABBUC paper-magazine #29, pages 6 & 7), means:
Atari Basic: YES! XL/XE Selftest: YES! Antic access: YES!

=> Note that so-called "Newell-compatible" Ramdisks (clones or
selfmade ones...) most likely do NOT have Antic access, due to
the lazyness of its creators or their intentions of simply not
needing it. However, original Newell Ramdisks created and sold
by Wes Newell do have the separate Antic access !!

- Newell Newell Ind. 4096k
4000-7FFF 0,1,2,3,4,5,6,7 B ($D301)
Banks: 00,01,02,03,04,05,06,07,08,09,0A,0B,0C,0D,0E,0F

Notes: uses 8 pc. 4Mx1 Chips (511000-80); made by Newell, later by
FTE;
seems to be very incompatible to existing software and bankswitching
cartridges (OSS, Atari, etc.), because normal RAM at 4000-7FFF is
NOT available - only extra Ram/Ramdisk banks. With one PIA chip there
is simply no bit left to switch between main RAM and extra RAM /
Ramdisk.
But with the installation of a second PIA chip one would be able to
do
so. Furthermore one may use (almost) any setup or banks he likes then
(with a second PIA chip one could control up to 256 Megabytes of
RAM).
built in Atari Basic: no! XL/XE Selftest: no (?) Antic access: no!

- Peterson 256k S.Peterson 192k
4000-7FFF 2,3,5,6 B ($D301)
Banks: A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to Buchholz, Rambo XL and newer Newell versions;
uses 64k as main RAM and 192k as Ramdisk; Antic access: no!
built in Atari Basic: YES!, XL/XE Selftest: YES!

- Peterson 320k S.Peterson 256k
4000-7FFF 2,3,5,6 B ($D301)
Banks: 83,87,8B,8F,A3,A7,AB,AF,C3,C7,CB,CF,E3,E7,EB,EF;
Notes: compatible to TOMS (?), incompatible to Compyshop!;
there are still the 64k main RAM plus this 256k extra RAM;
Atari Basic: YES! XL/XE Selftest: YES! Antic access: no!

- Peterson 576k S.Peterson 512k
4000-7FFF 1,2,3,5,6 B ($D301)

C1,C3,C5,C7,C9,CB,CD,CF,E1,E3,E5,E7,E9,EB,ED,EF
Notes: should be compatible to Newell & S.Peterson (?)
Atari Basic: no! XL/XE Selftest: YES! Antic access: no (?)

- missing info for the following Ramdisks:
other Bob Woolley Ramdisks, 600XL Ramdisks, Rambo XL (512k by
ICD), some more Compyshop Ramdisks as well as many other types;
- (?) means: info is missing or I am not absolutely sure about this
information; so this has to be verified by other Atarians;

For this 10th edition special thanks go to: Lee Barnes, Russ Gilbert,
Mathy van Nisselroy, Erhard Puetz, Mathias Reichl, Ron Hamilton, Wes
Newell, Guy Ferrante, XI of Satantronic and Bernhard Pahl for sharing
their info with me. Also thanks to John Picken for writing an
excellent
article about ramdisks and cartridges (especially about
bank-switching,
which both devices can do). And thanks to Jindrich Kubec (Jindroush)
for

presenting this fine article on his homepage... Thank you Folks !!
Well, thats it for today - there is still a lot of information
missing,
I know, but any help is appreciated. If you have some more information
or
other things that might help, let me know. Please do also send
corrections
since there will always be some updates and corrections nescessary.
Atarian Greetings - Andreas Magenheimer.

Hi,

I thought Jeff Williams owned the rights he even wrote OASIS 5.x but never released it.

I know OASIS jr is PD and all other versions are commercial. I have an original 4.8 but need the QWK-net modules written by Tom Hunt for it. But Tom doesn't have them anymore... Who can help me?

TXG/MNX

5197. Ramdisk info (software that supports a RD)

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-04 17:18:17 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3D9DCD59.1F70EE8C@students.uni-mainz.de>
Source record: 27068

Hello folks,
here is part two of my ramdisk info article - software that supports a ramdisk. It is still unfinished, but I have updated some things like:

- max. 76 chars. per line (hopefully this works now!);
- divided the software into two groups (DOS / Non-DOS) and four categories;
- sorted all entries alphabetically;
- added some more DOS versions;
- added some more Non-DOS programs;
- etc. (I don`t remember right now)...

greetings, Andreas.

--------------------------------cut here!---

8.12 Ramdisk-supporting Software:
(This is Version 2.0 from October 2002)

Well, I will only list those programs here that have BUILT-IN! ramdisk support. Why? Simply, because most if not all PD programs can support a RD, as soon as the user a) has a certain DOS or RD driver or b) has a special OS inside the computer or c) has any kind of special and non-standard hardware. Just one example: With the use of QMEG+ OS it is possible to freeze ZORK (or any other protected / unprotected program)
into the RD, then re-direct the RD as being drive 1 and finally boot Zork off of the Ramdisk, allthough Zork does not support a RD in any way.
The same funny things can be done to other copy protected programs and especially to unprotected public domain programs... Now, let me begin:

A) DOS programs:

a) Name(s) b) Author(s)
c) RD-type(s) d) max. size

- Atari DOS 2.0 (Atari Corp.) OSS/Atari;
a) Axlon-RDs (selfmade drivers!) unknown (maybe 128k?);
b) XE-RDs (selfmade drivers!) afaik 130XE (=64k);
(there are some more selfmade RD-drivers available!)

- Atari DOS 2.5 (Atari Corp.) OSS/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;

b) XE-RDs (selfmade drivers!) max. 2x128 kbytes;
c) Axlon-RDs (selfmade drivers!) unknown;
(there are very many selfmade RD-drivers available!)

- DOS 3.0 (Atari Corp.) ???/Atari;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen any (nor used DOS 3);

- DOS 4.0 (Atari/Antic) Michael Barall;
=> there should be some selfmade drivers for 130XE Ramdisks (and
maybe Axlon), but I have not yet seen them (nor used DOS 4);

- Bewe-DOS Bewesoft/J.Bernasek;
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Rambox (standard driver!) up to 128 kbytes;
(Bewe-DOS is compatible to Sparta-DOS but does not use the RAM
under the OS ROM! many tools can be used under both DOS versions)

- Bibo DOS Compyshop/E.Reuss;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade driver!) unknown;

- DOS II+D Version 6.x Stefan Dorndorf;
a) XE-RDs (standard driver!) max. 2x128 kbytes;
b) Rambox (selfmade drivers!) up to 128 kbytes;

- DOS-XE (Atari Corp.) ???/Atari;
a) 130XE-RD (standard driver!) 64 kbytes;
b) other RDs (really?!?) unknown;
=> has the same author as the unpopular (Atari) DOS 3.0 !!;
(in the Atari scene it is as unpopular as DOS 3 and DOS 4!)

- DOS-XF (Atari Germany) Reitershan Comp.
=> similar in function to Turbo-DOS 2.1XF (but with a nice
DOS 2.0 / 2.5 DUP-menu!) => see Turbo-DOS !!

- My-DOS 4.5x Wordmark/B.Puff+C.Marslett
a) XE-RDs (standard driver!) up to 1024 kbytes;
b) Axlon-RDs (standard driver!) up to ??? kbytes;
c) other RDs (MIO, BB, etc.) up to 1024 kbytes?;

- Smart-DOS Version 6.1 Ron Bieber;
a) XE-RDs (selfmade drivers!) up to ??? kbytes;
b) Axlon-RDs (selfmade-driver!) up to ??? kbytes;

- Sparta-DOS 1.x (400/800) ICD;
a) Axlon-RDs (??? drivers) up to ??? kbytes;
b) other RDs (??? drivers) up to ??? kbytes;

- Sparta DOS 2.x, 3.x (XL/XE) ICD / FTE;
a) XE-RDs (standard drivers!) up to 1024 kbytes?;
b) others (MIO, BB, etc.) up to 1024 kbytes?;
(maybe also RD-drivers for up to 16 Megabytes ?!?)

- Sparta DOS 3.3x (XL/XE) ???
=> see Sparta DOS 1.x, 2.x, 3.x !!
(especially made for use with BBS-Express-Pro!)

- Sparta DOS X / 4.x (XL/XE cart.) John Harris/FTE;
=> see Sparta DOS 1.x, 2.x, 3.x !!
(maybe with RD-drivers for up to 16 Megabytes ?!?)

- Super DOS 2.x Alan Nichols;
a) XE-RDs (standard driver!) up to 128 kbytes;
b) Axlon-RDs (standard driver!) up to 128 kbytes;

- Super DOS 5.x Alan Nichols;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) Axlon-RDs (standard driver!) up to ??? kbytes;

- Top-DOS 1.x ???
a) Axlon-RDs (standard driver!) up to 128 kbytes;
b) 130XE-RD (standard driver!) 64 kbytes;
c) other RDs (Mosaic?! driver!) up to ??? kbytes;

- Turbo-DOS 1.x, 2.x Reitershan Comp.;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (MIO, Irata, etc.) up to 256 kbytes;

- X-DOS 2.x Stefan Dorndorf;
a) XE-RDs (standard driver!) up to 256 kbytes;
b) other RDs (selfmade drivers!) up to ??? kbytes;

B) Non-DOS programs:

a) Name(s) b) Author(s)
c) supported memory d) RD-type(s)

- A-Base 130XE (TOOL) ??? (unknown);
64k, 128k 130XE-RD;

- Adalmar (GAME) F.Buettner (PPP);
64k, 128k 130XE-RD;

- Alphasys-Sample-Software (TOOLs) (Mirage+ANG);
a) 64k, 128k 130XE-Ramdisk;
b) 128k?, 320k 26AE-Ramdisk;
(there are several programs for 64k or 128k memory; there
is also one -and only one- program for 320k Ataris)

- Anime 4ever (DEMO) Sente-Software-Group;
64k, 320k 26AE ???, 8ACE ??? ;
(on 64k Ataris all pics load from disk, on 320k Ataris from Ramdisk)

- A.R.-The Dungeon (GAME) P.Price/Datasoft;
48k, 64k, 128k 130XE-RD;

- A-Text (TOOL) ??? (unknown);
64k, 128k 130XE-RD;

- Atari-Writer-80 (TOOL) (Atari);
48k, 64k, 128k 130XE-RD;

- Atari-Writer-Plus (TOOL) (Atari);
48k?, 64k?, 128k 130XE-RD;

- Basic-XE (TOOL) OSS/ICD/FTE
64k, 128k 130XE-RD;

- [The] Brundles (GAME) A.R.+C.S.S. (KE-Soft);
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Datei 4.x (database TOOL) Norbert Schlia;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Diskcomm. 2.x, 3.x (TOOL) Robert "Bob" Puff;
a) extra RAM (answer with Yes) detects up to 10 banks (dec.)?;
b) Ramdisk (answer with No) all DOS 2, My-DOS and Sparta RDs;
(Ramdisk size depends on the DOS and RD driver you are using, i.e.
with TurboDOS up to 256k, with MyDOS or Sparta up to 1 Megabyte,
etc.)

- Extended-Atari-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Extended-Turbo-Basic (TOOL) ??? (author unknown);
64k, 128k (RAM under OS-ROM!) 130XE-RD;

- Fampy 2.3 (Bootdisk; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Fampy 6.1i+ (ML-File; TOOL) Friday-Soft/W.Freitag;
64k, 128k, 192k, 320k 130XE-RD, AE & 26AE Ramdisks;

- Grafik+Sound Demo (DEMO) Dendrit-Soft/P.Sabath;
(48k?) 64k, 128k 130XE-Ramdisk;

- Howfen-DOS 3.x, 4.x (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Howfen-Tape-to-Disk (TOOL) ??? (author unknown);
48k, 64k, 128k and more 130XE-RD and more;

- Inertia 2.9 (TOOL) Mad Team;
a) 64k RAM (16k only) 16k usable memory (1 bank);
b) 128k RAM (16k+64k) 130XE-Ramdisk; (5 banks);
c) 320k RAM (16k+256k) 26AE & 8ACE RDs (17 banks);

- Megablast 1 (GAME) Thorsten Karwoth;
64k, 128k 130XE-Ramdisk;

- Midi-Pattern-Editor (TOOL) Raster/Radek Sterba;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE-RDs?;

- Midi-Player (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Recorder (TOOL) Ireneusz Kuczek;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- Midi-Sequencer (TOOL) Maciej Sygit;
64k, 128k, 320k 130XE-RD, 26AE & 8ACE RDs?;

- MSC-IDE interface software (TOOLs) M.Belitz+S.Birrmanns;
64k, 128k 130XE-Ramdisk
(some programs/drivers use the Ramdisk, if no Ramdisk is
available, they will use & erase the RAM area 4000-7FFF)

- [The] Muppet-Movie (DEMO) Mad Team;
64k, 128k 130XE-Ramdisk;
(on 128k Ataris some pics are loading from the Ramdisk)

- [The] Page Designer (TOOL) XLent
64k, 128k 130XE-Ramdisk;

- Paperclip II (TOOL) Batteries Included;
48k?, 64k, 128k 130XE-Ramdisk;

- Sweet Fantasy (DEMO) Tight;
64k, 128k 130XE-Ramdisk;
(on 128k machines the gr.9 pics are loaded from the ramdisk,
on 64k Ataris the gr.9 pics are loading from the disk drive);

- Syncalc "+" (TOOL) Synapse;
48k, 64k and more Axlon-Ramdisks;

- Synfile "+" (TOOL) Synapse;
48k, 64k and more Axlon-Ramdisks;

- Synhome "+" (TOOL) Synapse;
48k, 64k and more Axlon-Ramdisks;

(other programs by Synapse should also support Axlon-Ramdisks)

- Textpro 5.x (TOOL) Ronnie Riche;
48k, 64k, 128k and more 130XE-RD, 26AE & 8ACE RDs;

- The Browser (TOOL) CTH / Tom Hunt;
64k, 128k and more all Sparta-DOS Ramdisks;

- The Top-3 Demo (DEMO) W.F.M.H.;
64k, 128k 130XE-Ramdisk;
(the dancing girl -"Veronika"- supports 64k and 128k memory!)

- Typesetter XL/XE (TOOL) XLent;
64k, 128k 130XE-Ramdisk;

- [The] X-Files Shpoon;
64k, 128k, 320k 130XE-RD, 26AE or 8ACE RDs?;

- thats all I remember right now...

Note: - Axlon means any Axlon compatible Ramdisk;
- 130XE means 128k memory (64k RAM + 64k RD);
- AE means 192k memory (64k RAM + 128k RD);
- 26AE means 320k memory (64k RAM + 256k RD)
=> Compyshop types (and compatibles, like Mathy`s RD);
- ACE means 256k memory (64k RAM + 192k RD)
=> Newell, Buchholz, Peterson, Rambo XL (and compatibles);
- 8ACE means 320k memory (64k RAM + 256k RD)
=> Newell?, TOMS, Peterson, Rambo XL? (and compatibles);
- ? means I am (generally) unsure -or:- I am not sure if
the given information is correct (just check it out!);

Thats all for now. Thanks to Russ Gilbert and Lee Barnes for sharing
some
info with me. Any further help or info is welcome !! Andreas
Magenheimer.

5198. Ramdisk info (software that requires a ramdisk)

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-04 17:31:11 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3D9DD05F.9A787ECD@students.uni-mainz.de>
Source record: 27069

Hello folks,
here is the new(est) version of my ramdisk info-article - software that
requires a ramdisk. It is till unfinished, but I have updated some
things like:

- max. 76 chars. per line (hopefully!);
- divided the software into Non-Demo and Demo-Programs
(each consisting of four categories);
- sorted all entries alphabetically;
- added some programs + removed some programs;
- divided the Ramdisks into 3 types: a) 130XE (for all XE compatible
machines),
b) 26AE (Compyshop and compatible ramdisks), c) 8ACE (all other
ramdisks);
note: since I don`t have any 8ACE RDs, I could not test any programs
with them!
- etc. (I don`t remember right now)...

greetings, Andreas.

----------cut
here!----------

8.13 Atari-programs that require Extra-RAM / Ramdisk:
[This is version 2.0 from October 2002]

A) Non-Demo-Programs:

a) name(s): b) author(s):
c) memory (min.): d) RD-Type(s):

- 130XE-(Bank-)Tester (TOOL) various authors (PD);
128k memory (64k RAM + 64k RD) 130XE-Ramdisk (E3,E7,EB,EF);

- 192k-Memory-Tester (TOOL) various authors (PD);
192k memory (64k RAM + 128k RD) A,E Ramdisk blocks ?!?;

- 256k-Memory-Tester (TOOL) various authors (PD);
256k memory (64k RAM + 192k RD) A,C,E or 8,A,E blocks;

- 320k-Memory-Tester (TOOL) various authors (PD);
320k memory (64k RAM + 256k RD) 8,A,C,E or 2,6,A,E blocks;

- 576k-Memory-Tester (TOOL) various authors (PD);
576k memory (64k RAM + 512k RD) 8,A,C,E blocks;

- 1088k-Memory-Tester (TOOL) various authors (PD);
1088k memory (64k RAM + 1024k RD) 8,A,C,E or 2,6,A,E blocks;

- ATOS/ATari Operating System (TOOL) CTH / Tom Hunt;
64k RAM + 16MB-HD-Partition all Sparta-DOS Ramdisks;

- Boss-X - Version 10.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- Boss-XE - Version 8.x (TOOL) MS-Soft / Mirko Sobe;
128k RAM and more all DOS 2 und MyDOS RD`s;

- CAD-XE (TOOL) (HAPS-PD 0350);
128k RAM 130XE-Ramdisk;

- Castle of Blackthorne (GAME) L.o.D. / Thimo Graef;
128k RAM 130XE-Ramdisk;

- Cavepack (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Degas-View-XE (Tool) Mat*Rat / Mathew Ratcliff;
128k RAM 130XE-Ramdisk;

- Diskettenverwaltung 130XE (TOOL) (ABBUC PD 86);
(database 130XE) 128k RAM 130XE-Ramdisk;

- Draw XE (TOOL) (ABBUC PD 387);
128k RAM 130XE-Ramdisk;

- Dream Vision (TOOL) (ABBUC PD 480);
(IFF-Viewer) 256k RAM 26AE = yes ; 8ACE = ??? ;

- Filemanager/Filecopiers (TOOLS) various authors (PD);
128k=> 1 floppy is enough Sparta and DOS 2.x RD`s;

- Fraktale & Colorprint (TOOLS) (ABBUC PD 349); P.Woetzel;
(fractals & colorprint) 128k RAM 130XE-Ramdisk;

- Gizmo`s Castle (GAME) Black Panther / M. Kugler
XE-Version = 128k RAM 130XE-Ramdisk;

- Grafik-Zeilen-Editor (TOOL) (HAPS PD 0296);
(graphic-line-editor) 128k RAM 130XE-Ramdisk;

- Hi-Res Designer (TOOL) (HAPS PD 0015);
(gr.8 drawing program) 128k RAM 130XE-Ramdisk;

- Hires-Dump (TOOL) (ABBUC PD 113);
(gr.8 print-program) 128k RAM 130XE-Ramdisk;

- Inertia 4.5 (MODplayer TOOL) MadTeam
a) 128k RAM 130XE-Ramdisk
b) more than 128k RAM 26AE = yes!, 8ACE = ??? ;

- Kassettencopy (TOOL) (ABBUC PD 466); J.Gernreich;
(Cass.copy) Copy64 = 128k RAM 130XE-Ramdisk;

- Kemna-Video (TOOL) (ABBUC PD 185);
(intro-creator) 128k RAM 130XE-Ramdisk;

- Koenigsdiamanten (Game) KE-Soft / Kemal Ezcan;
XE-Version = 128k RAM 130XE-Ramdisk;

- Lightraces (Game) (Power per Post);
XE-Version = 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE 4.32 (TOOL) (ABBUC PD 297); T.Karwoth;
(older version!) 128k RAM 130XE-Ramdisk;

- Macro-Assembler-XE+ 2.1 (TOOL) (ABBUC PD 368); T.Karwoth;
(newer version!) a) 128k RAM 130XE-Ramdisk (MyDOS only!);
b) 128k - 1088k (MyDOS only!) 26AE = yes! ; 8ACE = yes! ;
(has a rambank-finder program that can be loaded from Basic or the
menu!; the assembler does not work on a CS ramdisk with refresh
bugs!)

- Mister X (Game) (Power per Post);
128k RAM 130XE-Ramdisk;

- Monitors, Debuggers & more (TOOLS) (HAPS PD 0109);
some programs require 128k RAM 130XE-Ramdisk;

- Multi-Tasking-OS (various ABBUC magazines);
128k RAM 130XE-Ramdisk (+ST-mouse);

- MTOS XE (Tool) CTH / Tom Hunt;
128k RAM 130XE-Ramdisk;

- MTOS 256 (Tool) CTH / Tom Hunt;
256k RAM (64k+192k) A,C,E - Ramdisk blocks;

- [Der] Neffe (Game) (ABBUC PD 52);
(the Nephew) XE-Version = 128k RAM 130XE-Ramdisk;

- [The] Newspaper-Editor (TOOL) (HAPS PD 0294 english!);
XE-Version = 128k RAM 130XE-Ramdisk;

- Oelbaron (Game) ??? (author unknown);
XE-Version = 128k RAM 130XE-Ramdisk;

- Programmverwaltung 130XE (TOOL) (HAPS PD 0434);
(database 130XE) 128k RAM 130XE-Ramdisk;

- (various) Ramdisk drivers (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- Rechnen fuer Kinder (TOOLs) (ABBUC PD 85);
(calculations for children) 128k RAM 130XE-Ramdisk;

- Rund um die Ramdisk (TOOLs) (ABBUC PD 383, HAPS PD 1084);
(RD-testers, etc.) 256k RAM and more various XE-RD`s & Axlon-RD`s;

- [The] Small Printery (TOOL) Walter Lojek;
128k RAM or more (up to 1MB) 130XE-Ramdisk (minimum!);

- Snapshot (Tool) ??? (author unknown);
128k RAM 130XE-Ramdisk;

- [The] Sound-Utility (TOOL) CTH / Tom Hunt;
(64k), 128k, 256k, 576k, 1MB 130XE-RD; 8ACE Ramdisks;

- Space Harrier (Game) Sheddy / Chris Hutt;
128k RAM 130XE-Ramdisk;

- Strategy Baseball (Game) (HAPS PD 0302);
128k RAM 130XE-Ramdisk;

- Super-Print-Lab-XE (TOOL) (HAPS PD 0909);
(demo-version) 128k RAM 130XE-Ramdisk;

- System+Memory Tester (TOOLs) various authors (PD);
128k RAM and more XE-RD`s, Axlon-RD`s, etc.;

- T-34 (Game) (ANG / Mirage);
128k RAM 130XE-Ramdisk;

- (various.) Tape-Copiers (TOOLs) various authors (PD);
128k RAM 130XE-Ramdisk;

- Tape-Ramdisk-Drivers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- Textpro "+" (TOOL) Ronnie Riche;
(e.g. Vers. 4.54+) 128k RAM 130XE-Ramdisk;

- The Code Cruncher (TOOL) Soused Teat / A.Bienias
128k RAM and more XE-Ramdisks;

- The Cruncher 5.0 (Tool) MSL / Magnus
128k RAM and more XE-Ramdisks;

- The [Sparta DOS] Wedge (TOOL) Ed Bachman;
128k RAM and more XE-RD`s with separate Antic!;

- The Works (Tool) CTH / Tom Hunt;
128k RAM and more 130XE and A,C,E Ramdisks;

- [Die] Wuerttemberger-Disk (TOOLS) (ABBUC PD 361, HAPS PD 1050);
also contains the XE-version of Gizmo`s castle => see Gizmo`s
Castle!;

- (various) XE-Sectorcopiers (TOOLs) various authors (PD);
128k RAM and more XE-Ramdisks;

- XE-Utilities (10 XE-TOOLs) (HAPS PD 0031);
128k RAM 130XE-Ramdisk;

- XL-2 (Tool) John K. Picken;
128k RAM and more all Sparta und DOS 2.x RD`s;

- Zargon (german text-adv. GAME) (ABBUC PD 611, HAPS PD 0485);
128k RAM 130XE-Ramdisk;

- [Der] Zeitungsredakteur (ABBUC PD 121, german!);
(newspaper-editor) 128k RAM 130XE-Ramdisk;

B) Demo-Programs:

- 130XE-Artshow (Koala!) (HAPS PD 0013);
128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Autoshow (Oldtimers!) (ABBUC PD 191, HAPS PD 0637);
(130XE carshow) 128k RAM 130XE-Ramdisk;
(simply exchange the picture viewer for use with 48k or 64k Ataris!)

- 130XE-Demo S.A.G. (Netherlands);
128k RAM 130XE-Ramdisk;
(written in TB; change all D8: entries into D1: for use with 48k and
64k Ataris; exchange Turbo-Basic XL with TB 3.2q, TB 400 or Frost
Basic for use with older 48k Ataris or (most versions of)
Sparta-DOS)

- 130XE-Impossible-Demo Rudy Haegemann / V.T.B.;
128k RAM 130XE-Ramdisk;

- Amiga-Boink-XE Bob Armour;
128k RAM 130XE-Ramdisk;

- American Natives Fox-1 / R.Verdaasdonk;
256k RAM all DOS 2 und MyDOS RD`s;

- Base-33 AIDS / AIDZ;
320k RAM (with Setup!) 26AE = yes ; 8ACE = yes ;
(=> hold down SHIFT upon bootup to get to the Setup-menu!)

- Bill-Pie-Demo ??? (authors unknown);
a) 128k RAM ($36 frames) 130XE-Ramdisk;
b) 320k RAM ($96 frames) 26AE = yes ; 8ACE = ???;
(=> this demo chooses the Ramdisk & Setup automatically!)

- BMW-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- CES-XE-Demo XANTH (full version);
128k RAM (580 sectors) 130XE-Ramdisk;

- Cogito-Demo AIDS / AIDZ;
192k RAM 26AE = no ; 8ACE = yes ;

- Comet-Ani MadTeam;
a) 128k RAM ($36 frames) 130XE-Ramdisk;
b) 320k RAM ($96 frames) 26AE = yes ; 8ACE = ??? ;
(=> this demo chooses the Ramdisk & Setup automatically!)

- Danielle-(Gr.9-TB-)Ani NBS / Bill Kendrick;
a) 64k RAM (499 sectors) Disk = very slowww!;

b) 128k or Harddisk RD/HD = much faster !!;
(=> use your favourite DOS, Turbo-Basic and a RD/HD driver!)

- Edelweiss-Demo A.R. + C.S.S. + S.V.L.;
320k RAM 26AE = yes ; 8ACE = ??? ;

- Ergo-Bibamus Quasimodos;
128k RAM (with Setup!) 130XE-Ramdisk;
(well, for 130XE and compatible Ramdisks no setup needed!)

- Glashead / HTPPD A.R. + C.S.S.;
320k RAM 26AE = yes ; 8ACE = ??? ;

- Halle 1994b: Wormhole A.R. + C.S.S.;
320k RAM 26AE = yes ; 8ACE = ??? ;

- (Atari) Hardware-Demo A.R. + C.S.S.;
320k RAM 26AE = yes ; 8ACE = ??? ;

- Igor Demo MadTeam;
a) 128k (Part 1, Part 2) 130XE-Ramdisk;
b) 192k (Part 3) 26AE = yes ; 8ACE = ??? ;
c) 320k (Parts 1+2+3) 26AE = no ; 8ACE = yes ;
(=> the demo normally runs a setup for 320k memory; but there are
2-3
batch files for each Setup; goto DOS and install the one you want or
need with the JOB command: JOB @xxx.BAT [RETURN], then reboot disk)

- Imperial (Sounddemo) Innovative;
320k RAM 26AE = ??? ; 8ACE = ??? ;

- Impossible but Real! MacGyver / AIDS;
256k RAM (with Setup!) 26AE = yes ; 8ACE = yes ;
(=> press A for 8ACE-RDs, press B for manual setup of other RDs)

- Isolation Demo Masters of Electric City;
128k RAM 130XE-Ramdisk;

- Journey Polynomials
a) 128k RAM ($36 frames) 130XE-Ramdisk;
b) 320k RAM ($96 frames) 26AE = yes ; 8ACE = ??? ;
(=> this demo chooses the Ramdisk & Setup automatically!)

- Journey into Sound DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- Khai-Et AIDS / AIDZ;
320k RAM (with Setup!) 26AE = yes ; 8ACE = yes ;
(=> hold down SHIFT key upon bootup for the Setup-menu)

- Killer-Whales MadTeam
a) 128k RAM ($36 frames) 130XE-Ramdisk;
b) 320k RAM ($96 frames) 26AE = yes ; 8ACE = ??? ;
(=> this demo chooses the Ramdisk & Setup automatically!)

- Lajf-Demo MadTeam;
128k RAM 130XE-Ramdisk;

- Landscape-XE-Demo Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Megablast-Sounddemo DGS / Dean Garaghty;
128k RAM 130XE-Ramdisk;

- MTV`s-Danielle see: Danielle-Ani.;

- Nascar-Animation MS-Soft / Mirko Sobe;
128k RAM 130XE-Ramdisk;

- Nonjm-Demo TIGHT;
128k RAM 130XE-Ramdisk;

- Numen-Demo Taquart;
320k RAM (with Setup!) 26AE = yes ; 8ACE = ??? ;
(=> if your Ramdisk uses other blocks than 26AE, you have to create
a
somewhat strange *.CFG text file with 16 data bytes for the
Rambanks!)

- Owca-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Owca-2-Demo Animkomials;
128k RAM 130XE-Ramdisk;

- Parrot-X-MAS-Demo Anthony Ramos;
128k RAM 130XE-Ramdisk;

- Pedrokko-Sounddemos Pedrokko (10 Disks / 20 S.);
128k RAM (some demos) 130XE-Ramdisk;

- P.I.T. - Demo Quasimodos;
320k RAM (with Setup!) 26AE = yes ; 8ACE = yes ;
(=> the Setup appears automatically; setup 15 banks to run the demo!)

- Raving Vierpz Pentagram;
128k RAM 130XE-Ramdisk;

- Raytracing 320k Elsni;
320k RAM (TB listings!) 26AE = no ; 8ACE = yes ;

- Raytracing 1MB Solocoder of A.C.E.;
1088k RAM (K.Peters Megaram 3) works only on K.P.-1MB-RD !!;
(=> Bootdisk with 8 disksides; loading time: approx. 17 minutes!)

- Raytracing Animation Karl Pelzer;
128k RAM 130XE-Ramdisk;

- Revenge of Hacker Rasero Team;
320k RAM 26AE = yes ; 8ACE = ??? ;

- Sweet Fantasy TIGHT;
128k RAM 130XE-Ramdisk;

- Sheol Bit Busters;
320k RAM 26AE = no ; 8ACE = yes ;
(on 26AE / CS - Ramdisks you will merely receive an error
message like this: sorry, this demo needs 256k of xms RAM)

- Shiny-Bubbles-XE Brian Paul / LACE;
XE-Version = 128k RAM 130XE-Ramdisk;

- Stash-Demo Rasero-Team;
320k RAM (with Setup!) 26AE = yes ; 8ACE = yes ;
(=> in the first menu press A for 8ACE Ramdisks or press B for
manual setup of other Ramdisks like Compyshop; in the second menu
press A for 8ACE Ramdisks or C for manual input of Rambanks; don`t
press B -Compyshop- here, since this CS setup is faulty/wrong)

- Starwars-Demo A.R. + C.S.S.;
320k RAM (hold down Option-Key!) 26AE = yes ; 8ACE = ??? ;
(the program checks if Basic is disabled via the Option key, thus
an OS with inverted Basic / Option-key function does not work here!)

- The Asskicker Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- The Turtles-Demo (Animation!) Ultra-Software;
128k RAM 130XE-Ramdisk;
(the file version by John E. requires 128k, maybe this bootdisk also)

- Timekeep(er) New Generation;
320k RAM ??? 26AE = no ; 8ACE = ??? ;

- Tit-Demo MadTeam;
256k RAM (with Setup!) 26AE = yes ; 8ACE = yes ;
(=> the Setup appears automatically; accept or change it !)

- Too-Hard-2 Animkomials (Rippers!);
128k RAM 130XE-Ramdisk;

- Too-Hard-3 Animkomials (Rippers!);
192k RAM 26AE = yes ; 8ACE = ??? ;
(=> the Setup appears automatically; accept or change it!)

- Total Daze TIGHT;
128k RAM 130XE-Ramdisk;

- Trabant Demo / HTPPD A.R. + C.S.S.;
320k RAM 26AE = yes ; 8ACE = ??? ;

- Trip-6-Demo Shadows Computer Group;
128k RAM 130XE-Ramdisk;

- Ultra Taquart;
128k RAM 130XE-Ramdisk;

- Vengeance Excellent;
128k RAM 130XE-Ramdisk;

- Vent Excellent+Pentagram;
128k RAM 130XE-Ramdisk;

- Video Blitz Helvetica Bold;
128k RAM (+sep. Antic!) 130XE-Ramdisk + sep. Antic!;

- WAF-Demo (Side B) ABBUC regional group W.A.F.;
128k RAM (2 Parts!) 130XE-Ramdisk;
(=> here the Raytracing and Vector part require 128k memory!)

- Worms-Demo Datri;
320k RAM 26AE = bugs! ; 8ACE = ??? ;

- X-Demo Mad Team;
320k RAM 26AE = yes ; 8ACE = ??? ;

- Xyberscape-XE Bill Le Masurier;
128k RAM 130XE-Ramdisk;

- Zero-Demo New Generation;
128k RAM 130XE-Ramdisk;

Notes: - Compyshop-Ramdisks, Compyshop-Megaram 1,2,3
& Mathy`s RD have/use 26AE Ramdisk blocks;
- afaik all other Ramdisks have ACE (8AE) or 8ACE blocks;
- ??? means unknown; TB means Turbo-Basic (XL);
- HTPPD means Hobby-Tronic-Power-Pack-Demo;
- sep. Antic means separate Antic access of the RD;

Since I don`t have any 8ACE Ramdisks, I could not test any program
with these types. However, any corrections and/or updates are welcome.
- Andreas Magenheimer

2002.08.13 removed entry for Databyte / M.faust
2002.08.13 removed entry for Firma Mileng
2002.08.13 Miro Kropacek (MiKRO) updated, Sprite Editor 1.2
2002.08.11 Digital Data Factory updated
2002.08.09 added Quasimodos

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

SAE/SASE/IRC info from http://www.genfair.com/greenpages/sae.htm
---
It is courteous when writing to any new correspondent to cover in advance their postage costs in replying to you. If they are in the same country it's a simple matter to enclose an SAE (stamped addressed envelope), which is known in American English as an SASE (self-addressed stamped envelope). It is not always obvious how to do this for correspondents in another country. One answer is to use International Reply Coupons.

An International Reply Coupon can be purchased at any Post Office in any country in the world. This is agreed through the Universal Postal Union. You can then send the IRC to someone in another country who can cash it in at a Post Office there for a postage stamp covering the minimum rate for an Airmail letter (unregistered).

One IRC enables a letter up to 10 grammes to be airmailed abroad. That's not much more than a couple of sheets of paper. So if you want a reply with more than this, better send two or more IRCs!

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

5201. Someone upgraded the XF551 to 1.44Mb?

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-04 18:42:21 UTC
From: TXG <txg@the-underground.myweb.nl>
Message-ID: <anknehsdh1@news1.xs4all.nl>
Source record: 27072

Hi,

I wondered if some ever did manage to make a full stable working 1.44
upgrade for the XF551.

A 16Mhz cristal with the AJAX controller can do the job I think, but can the
8040 handle the speed?

TXG/MNX

5202. Re: 800xl video pinout

Newsgroup: comp.sys.atari.8bit

pinouts are in the FAQ.
Seems 800xl didn't have the separate chroma,lumina
if I remember.
It is sometimes hard to tell if you're looking at the
socket or the pins on the cable, mirror image.

I _thought_ they did. I'll have to fire up my 800XL and switch my Commodore monitor to Chroma/Luma mode and see what it looks like.
(I know graphics8 mode looks much crisper, but I forget if I have color.)

Andreas,

I think it's totally unfair to link Jiri with "no time" or "no motivation". I would guess that he's the most productive member of the whole ABBUC community. I'm often amazed how much he achieves in little time. Writing a complete DOS from scratch, an excellent packer, network games, ABBUC menu, etc.

Ok, I'm not very objective here since Jiri is a good friend.

So, now let's talk about the things you've made for the Atari 8-bit. ;-)

Freddy.

> the more modern 5.25 drives are no problem.

In one of my XF551's I place an EPROM with both the original o.s. and the "80-tracks" o.s. by Bob Woolley with a 5,25" mechanic
taken from a Cumana external diskdrive for the Atari ST line. Works great, as this mechanic has a switch on the front to switch
between 40-tracks and 80-tracks. The switch will now also switch the EPROM between 40- and 80-tracks mode. This way I can use
just one mechanic for "high-capacity" 720Kb disks without having to give up the option to use standard 360Kb XF551 disks.

> A black front would be good,
> since the XF551 case is black too. :-)

Mine is still ST/XE-grey, as is the mechanic :-))

My first steps into the PC world was when using SIO2PC running on two XT's, "networked" using FastLynx on the LPT-ports, with a
textballoon above my head with a big questionmark inside together with the text: "how long does it take until someone connects
this PC parallel-port to his MUX system"...

> I know, some programs are really dirty on the I/O level. I also avoid
> programs which by-pass DOS, writing their owns sectors to disk, extremely
> dangerous!

Tell TXG about it :-)) The version of BiBo-DOS loaded from the Speedy-1050 EPROM is notorious about this, especially when having
in mind to copy a disk with drive-redirection enabled on the BlackBox and when formatting has started :-))))

> > KMK made a thing called "PIO2PC". It connects to the cartridgeport.

> Ok, thanks. I'll take a look at it.

I have the info on my BBS I think, but no way to acces it right now...

> drives

Needs extra I/O buffers, which results in a MemLo issue (as you did mention yourself)

and b) up to 1440kbytes (disk) and up to 16 Megabytes (harddisk).

No problem when using the Sparta-Dos utils when creating a disk/partition.

> Of course all the Bewe utilities (like Format.COM, Menu.Com, etc.)
> should then be patched also for the new options.

I.i.r.c. "menu.com" works o.k. on 16 Mb partitions once the partition is created with the SD utils.

> Unfortunately he told
> me that he neither has the time nor the motivation to do so.

I think he does have the motivation, but not the time.

> Well, looks like we have to live with the latest Bewe-DOS version 1.3.

Since there seem to be no bugs in it, I don't think it's that bad. As long as one sees BeWe-Dos as a mini-Sparta-Dos, it does the
job.

> P.S.: We can buy almost everything, except TIME (or another LIFE)...

If I had the money, I would go for buying time, as I already have a life :-)

up the option to use standard 360Kb XF551 disks.

Sounds like 'fun' again. ;-)
Serious, is there any use for 3.5 disks on the A8?

> >A black front would be good,
> > since the XF551 case is black too. :-)
>
> Mine is still ST/XE-grey, as is the mechanic :-))

I sprayed it black because the previous owner smoked it yellow and I
couldn't get it cleaned.

Freddy.

5218. Looking at REAL.DOS

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-05 00:32:58 UTC
From: sjcarden@bellsouth.net
Message-ID: <1936fce9.0210041632.5a28eecf@posting.google.com>
Source record: 27089

This is what I have in mind for Real.dos

Hardware Support

Support for the following Operating Systems.
Atari XL/XE OS
Ominview OS
OminMon OS
Mux OS
Ultra Speed Plus
Turboss
Turboss Plus

Support For These PBI
MIO
Black Box (in all of it Variants)
KPI Interface

Support for these SIO Drives
Duplicator 1050
Happy 1050
US Doubler 1050
XF551 unmodified
XF551 Modified
Super Archiver with or without Bit Writer
Indus GT

All Carts

Software Changes
I am thinking of just using the MS-DOS Command set. But I would like feedback, so if there is a reason to keep CPM commands I will depend on Space available at MEMLO.

When REAL.DOS load it will look at your system and load the proper CIOV handler according to your Operating System, floppy drives. It will look to see if you have a PAL or NTSC machine and change the jiffy clock accordingly. It Will BE backwards compatible with SpartaDOS 3.2n and 3.3n formatted Drives or HD partitions.

I am building a switch less SmartOS and Battery Backed up 512k RamDisk Hardware mod that REAL.DOS will also support. However REAL.DOS will not require it.

If you have a CSS Black Box, REAL.DOS will support, in a backwards compatibility SpartaDos format HD Partition of 1,536 Megabytes. Yes, I did SAY 1.5 gig. I have all ready written and tested this. This

Number is the maximum number that a BlackBox Can handle with out rewriting the BlackBox Rom. If you have a MIO or KPI it will still be 16meg partition for you. However the largest size of a single file cannot be larger than 15.5 Meg this is due to the backward compatibility mode.

I am also looking for someone who has a web site to carry the Schemitic.

Steve,

5219. Adding a cooling fan to a 1050 disk drive?

Newsgroup: comp.sys.atari.8bit

>(I know graphics8 mode looks much crisper, but I forget if I have color.)

Nope. I just recently did some SuperVideo mods and I can tell you that
these models do not have the chroma signal at the monitor jack:

800XL, 1200XL (for sure)
600XL (missing the whole jack I think!)

These models do have it (IIRC):

400/800
65XE/130XE
1400XL/1450XL (??? I think it does, never seen one)

The stock 800XL did not have YC video outs. There were a number of mods which added it though. The basic signals are present on the 800XL board, they just weren't finished all the way to the monitor jack for some reason. Most hardcore XL owners have done one of the mods though.

I don't know about that program, but I myself wrote several fractal programs
in TurboBASIC, I think one of those was more or less like the one you described.
Oh, I believe when I ARCï¿½d the files from the disk I had them on, a program
from Antic may have been included among them... Check my page here:

[...]
> Nope. I just recently did some SuperVideo mods and I can tell you that

Yeah... That was exactly what I found on the net. I hope Fox-1 now
understands my problems finding the pinouts... ;-)

Fox-1 states on his pages:

http://www7.brinkster.com/atari/pinouts.htm#pinouts

that chroma was there on Pin 5 while Paul Alhart wrote:

pin 1 Composite Luminance
pin 2 Ground
pin 3 Audio
pin 4 Composite Video
pin 5 not used

and that Pin5 is NC.

What I am trying to find out if the following statements are true:

1. All the 800xl PCB revisions had Pin5 NC out of the box.
2. All the 800xl PCB revisions had Pins 1 through 4 connected as Paul
above (and the FAQ) says
3. If there is a chroma signal on Pin 5, it must have been the result of
a user's modification.

Folks,

thanks very much. With the hint to ATARI Magazine 4/87 I was able to find the "apple mountains" program and article in my disk collection. I also have the other one, the one with the clouds - on a disk.

There is one interesting point remaining that I still wonder about: The article that I remember specifically talked about the dot they place on top of each bar that they draw in the picture and if I remember correctly they also talked about how they produce the effect with the light. This is not the case in the "apple mountain" article, so I think I remember another one.

Possibly is is the article from Happy Computer that Hias mentioned, so Hias, if you would be willing to dig a bit in the old magazines - if your time allows - and possibly send me a scan of the article I would highly appreciate that. Even if it takes weeks, no problem, I am more than willing to wait. If this doesn't work out, of course no problem, I will keep digging. :-)

thanks!!!
Chris

5231. parallel bus interface specs from atari-history.com & S-16 Expansion box specs

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-05 15:47:53 UTC
From: Christopher Lang <christopher.lang@plus.cablesurf.de>
Message-ID: <ann1lm$6n3$1@nntp.gatel.net>
Source record: 26902

Folks,

on the page: http://209.122.187.156:8082/pbi-1.html the parallel bus specs from Atari are available. (atari-history.com in the Atari Articles section).

In there there is a reference to an S-16 device which obviously must be the parallel bus expansion box.

There must be a document somewhere called "S-16 Expansion Box Specification A.Chopra" which contains all the specs for the 8-bit expansion box.

Did somebody ever see this doc somewhere on the Internet?

thanks!
Chris

I just put a fan on the table where the drives are.
I don't think it would be easy to put one inside
the drive.
This always worked for me.
I ran a BBS many years ago with RANA drive.
The RANA would overheat and quit functioning.
A small table fan blowing accross worked fine for me.

> Do you have the manuals and technical details of those MUXes ?

The manual is on the CSS site: http://www.nleaudio.com/css/products/Mux_docs.htm

As for the technical aspect, I have the schematics, the info to make the PCB's, and the EPROM source, but I'm not allowed to give
it away...

> Somehow I never thrusted the 'Bibo' stuff.

The great advatage of the BiBo-DOS in the Speedy-ROM is nice since it's always there and boots extremely fast. Nice to quickly
format a disk, copy some files, or list a directory... Nothing more...

> I don't remember using anything
> 'Bibo'. In the beginning I was more into 'Super'. :-)

Super-Dos? Used it in the beginning when searching for a DOS 2.5 replacement that could handle my double density drives. Didn't
really like it. Too much "press [Y]es" and [N]o" questions when wanting to format a disk or copy a file...

Instead of a fan, maybe a better solution is to go with an external power
supply? I've an old Tower with an AT style power supply.

Absolutely, a dvd video would be nice, along with 50 pages of instruction,
in triplicate(in case I lose the first two copies), each signed in blood.
Almost forgot, toll-free number for technical support.
:)

Ok, maybe instructions are a bit much. An 'explanation' of what's been
done before might be better. At the time of the question, I was thinking
more along the lines of location of the fan, i.e. above the power supply, or
possibly in the rear of the drive.

True, so you're using it to backup data? SIO2PC would be a better option.
Exchange software with other Atari users? Just add an ATR to an email.
Because it's 'fun'? ;-)

Freddy.

5240. POKEY zapped my Rana 1000! 8-(

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-05 19:43:59 UTC
From: Anthony Ramos <aramos@ele-mental.org>
Message-ID: <3d9f40ef$1@nntp0.pdx.net>
Source record: 26911

A kind soul here on c.s.a.8 helped me locate a Rana 1000...only a few weeks later, it stopped reading and writing, and just gave timeout errors. Tracked it down to the computer's POKEY chip! A couple of pins were corroded and eventually shorted, zapping the drive.

The motors still spin the disk and seek the read/write head, so I'm guessing it's parts in the communication section of the logic board that got fried.

I'd really like to get this drive working again. Does anyone have schematics for the circuit board? Or, maybe a spare/parts board I could work with?

Thanks,
Anthony R. (author of Parrot + Creepy Caverns)

5241. APE for windows

Hi Everyone,

Just a happy message:

APE (for Windows) is great. You definately should give it a try, ... and if
you like it: don't forget to register.

Please support people who are keeping the atari 8bit scene alive.

Greetz,
Marius

There is a user mod to add Composite Chroma. A 220 ohm resistor is run
between pin 5 & the junction of R66 & R67.
I think the mod was published in AIM (Atari Interface Mag.)

Is even better, but then you'll have to remove the internal voltageregulators to power it with 5VDC and 12VDC in stead of the
standard AC adapter.

> > Instructions??? To make a hole and put a fan behind it???

> Absolutely, a dvd video would be nice, along with 50 pages of instruction,

I can't accomplish any of the above, except for the "signing in blood" :-)

> done before might be better. At the time of the question, I was thinking
> more along the lines of location of the fan, i.e. above the power supply, or
> possibly in the rear of the drive.

Just wherever you have the space to mount one. Depends much of the size of the fan. I built mine in the top cover (mounted
horizontal, blowing vertical) using a flat fan, in a way it is located halfway above the big capacitors and the inner corner of the
heatsink. Works o.k, even when the drives are stacked, since there is enough space between them to let the hot air flow out (that
is when you mount them in a way the hot air will be sucked out of the case of course :-).

I used a 12VDC fan, connected directly to the bridge-diodes-output in the 1050 with a 9V voltageregulator (small type 7809) in
between to let them rotate without much noise. I also added a switch on the back to shorten the regulator to let them spin at full
speed, but this was an useless feature :-)

I once made an automatic regulated cooling-system for my Zetagi RF amplifier. The four fans always rotated a little bit, with
speed going up when temperature was raising, and always at full speed when transmitting. I think this is a bit overkill for a
1050...

Well, mine doesn't, unfortunately. I guess I was thinking of my
SuperVideo 1200XL that Mr. Woolley still has. :^)

(Damn - ABACUS met today - If it weren't for being insanely busy, I'd've
tried to make it.)

When I switched my Commodore 1902 to 'SEP.' (separated) mode, the
standard blue GRAPHICS 0 screen on my Atari looked kinda like this:

```
|||||||||||||
|||||||||||||
|||||||||||||
|||||||||||||
|||||||||||||
```

If I set the colors to pure black-n-white, it looks great, though. ;)

Only some of the asm-sources I coded myself of which I'm sure no one else has them.

> SIO2PC would be a better option.

And as media for the back-up we use an ATR located on a harddisk running on a PC which runs Windows which crashes several times a
year, while the original is stored on a harddisk connected to an Atari which never crashes??? :-)

> Exchange software with other Atari users? Just add an ATR to an email.

If I send files, it's as Atari files, packed with LZH (or sometimes ARC) , depackable on all platforms, including non-Windows PC's,
MAC's, ST's, Atari XL/XE, and even C63+1 and ZX Spectrum if you want :-) (no, I don't think the ZX81 has UnLZH :-)

> Because it's 'fun'? ;-)

Hardcore Atari-users don't make back-ups. Back-ups are for people who don't thrust their system cause of system-failures :-))

So, when are you going to come get this thing.... it is cluttering up my attic! I'm going to start charging you rent. :>)

You get that vertical bar look when you feed the composite output into a separate chroma LUMA input. The color carrier is not stripped out of the signal - it all comes in as luminance. You have to use the LUMA output of the 800XL (or any other Atari) if you want clean video. On the 800XL, since you have no CHROMA, you can just use the composite output as CHROMA and the LUMA output as LUMA. Not great, but it works without opening up your machine.

Bob

5258. fake cart made out of game cart??

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-06 14:01:33 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <anpfpo$75b$1@reader13.wxs.nl>
Source record: 26929

Hi!

I made my own HARD RESET key. I did modificate a super break out cart. I cut the connection between pin 13 and 14, and placed a resistor and a SWITCH between those two points. That is all. So the whole cart is the same as before, and all those lines are connected to the cartridge port.

The good part is: it works great. I can make a hard-reset without switching off my Atari. My Ramdisk is still ok after booting.

The bad part is: I have the feeling this way CAN'T be healthy for my atari. In fact this is the same as pulling out and pushing in carts while the system power is on.

Btw. there is no black box connected to this computer.

If it is not a safe way. What else should I do? I had the idea of cutting some lines between the cartport and the cart itself.

greetz.
Marius

5259. Atari 8-bit CD-ROM #2 available to buy now!

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-06 14:17:34 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1033914123.4211.0@iris.uk.clara.net>
Source record: 26930

Hello All,

I'm pleased to announce that my second CD-ROM of Atari 8-bit software is now available to buy. This CD contains:

* Print-Filer from Rambit
* Alien Blast from Richard Gore
* Demo Maker/Edit 7 from Richard Gore
* AMS 96 video in MPEG-1 format
* PD: Bash-A-Drum
* PD: Dean's Desktop System
* PD: Don't Ask Software Demo Disk
* PD: Education Disk 1
* PD: Football Fantasies
* PD: Journey Into Sound Demo Disk
* PD: Parrot Demo Disk
* PD: Programmer's Speech Tool
* PD: Quick Demo Disk
* PD: This & That Disks 1&2
* PD: Tiger Developments Demo Disk
* PD: Voicemaster Demo Disk

The cost of this CD is US$12 INCLUDING shipping. Or, you can buy it as a combo with the first CD (DGS/PPP products) for US$25 the set INCLUDING shipping.

To see more detailed info, and to order the CD, please visit http://www.dgs.clara.net and click the option for the 2nd CD-ROM.

I read that each MUX slave needs a new OS. This is understandable since the cartridge port is not bootable in the normal OS. That's why I think the PBI port would be a better idea to do 'high-speed' networking. A second solution would be a wiring of SIO and Cartridge combined. That way the handler can be booted (SIO) and the rest of the communication done through the cart port.

For the MUX solution, I made a mistake by talking about the PC as a MUX _slave_. As I understand it now, the PC should be the MUX _host_. The low-level I/O stuff could be done through the MUX system itself and the high-level (file) server (the frozen project I talked about) through an extra device handler.

Freddy.

One of the things I don't really understand... One can "boot" his PacMan cartridge from the cartridgeport to play the game, but
one can't load a program that copies a MUX-hander to the right location?

> That's why I think the PBI
> port would be a better idea to do 'high-speed' networking.

As for the highspeed... I don't think there is a speed-difference in using cartridge or PBI. The PBI however has some advantages
over the cart-port, but there is already some software for the MUX, and I want to be compatible with that...

> A second solution
> would be a wiring of SIO and Cartridge combined. That way the handler can be

I use scopy and discomm, you can use diskcomm to transfer the disk to the 8bit
hard drive or ramdisk first and then exit APE and turn on the 1050.
this work well if APE dosent like the 1050 on at the same time.

From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <anq3sa$no6$1@reader12.wxs.nl>
Source record: 26939

Hi!

I try to make a few game disks with the SPEED - Start Initializer v. 3us (BIBO)

And I don't get it worked. What things must I do to get my gamedisk with a menu?

I can initialize a disk with it. It seems to be some kind of BIBODOS format. I can copy files with BIBO dos to it. With DOS 2.5 that seems to work too, but then the free sector indicator fails. But ok... i get Files on it.

But then... I choose name input in the program, and then he can't find a thing. At point A:

A] NEW INITIALIZED DISK
B]
C]
D]
etc.

What goes wrong here?

Marius

There is no problem. I have had a similar set up for years on BASIC carts.
It is not the same as pulling & plugging the cart as the power to the cart
remains uninterrupted. Paul

A good question! Yes, it is possible to let the cartridge add handlers in
the boot process.
Hm, now I have to think again why the MUX needs a modified OS. Ah, it must
by-pass the SIO. Ok, that's in line with my previous message, the MUX can
handle the low-level I/O. :)

> > That's why I think the PBI

I didn't say there's a speed difference.
There's not much software for the MUX and I don't think there are many MUX
users. A free and open hardware design could get better support from
developers. In that case I would choose a PBI design.

AFAIK he was only 'thinking' about it and he wanted to use a joystick port.
He didn't care much about 'booting', so I don't think he wanted to use SIO.
What did you write? I missed it.

Uhh, losing data is OFTEN caused by human failure, so, not always. At the time you loose data by you own failure, you're human...
When loosing data after a system-crash, you're out of your mind, and since humans have a mind, you'll not be human for a while...
untill you're calmed down... to become... a human... again... or... something like that...

I give up...

> users.

There is indeed not that much software, but some versions of Sparta-Dos can work with the MUX, and my BBS is also MUX compatible
(to run multiple nodes).

> A free and open hardware design could get better support from
> developers. In that case I would choose a PBI design.

Maybe a new design could be made backwards compatible? (More or less. If at least the protocol is the same, one can change some
things like vectors with a sectoreditor or disassembler)

> > A few days ago I wrote something about it over here. Wasn't Yeb Havinga

> What did you write? I missed it.

You haven't missed a lot. I just mentioned that some time ago someone was thinking of combining the SIO and the cartridge-port to
make a thing like a SIO-2-PC, but with partially parallel datatransfers.

> > The Atari as host (making the PC a slave) sounds much better to me :-)

> And can you explain why??

> Maybe you just prefer the terms Client/Server where the PC 'serves' the

Indeed :-) As for SIO-2-PC and APE, only the idea of making the PC an Atari slave is enough for me :-)))

Hm, what should be backwards compatible? Do you mean the MUX M: handler?

The Client/Server protocol I have in mind (and documented) can be
implemented for MUX, SIO2PC and other connections. I would start out with
SIO2PC.

Source record: 26954

It depends on which 800xl keyboard you have. Some had individual switches and some had a sheet of mylar switches. Pry the spacebar up and off. If there are switch contacts to be seen, clean them. Otherwise you will have to remove the keyboard, disassemble it, & clean the contacts on the mylar sheet. Use a cloth lightly dampened with alcohol. Most commercial contact cleaners will dissolve or damage the mylar or contact material. Paul

ABACUS in San Francisco (which I only recently learned still existed;
I used to call their BBS ~10 years ago (yikes!)), which apparently meets
on the 1st Saturday of each month. They mostly focus on ST lately, but
say they'll take 8-bitters, too. :^)

I need to finish the new game I just started writing, so I can come to a
meeting and show it off. :^)

About 8-10 years ago, I had gone to a couple of SLCC (San Leandro Comp. Club)
meetings; they were an Atari 8bit/ST group, as well...

Welcome to the area! I'm out here in Davis (near Sacramento).

Hi!

On the atari 2600 I have a bit rare game "Midnight Magic" It is one of the first Pinball Games that is really fun to play on a computer (that is MY opinion)

I hate those "stupid" pinball creator games. All the same crap.

I want that nice Midnight Magic on my XL. Is that game (or something very like it) available on the XL?

Thanks,
Marius

So, actually it'll be a sort of ASPI-layer, but for a network-device? And when someone developes his own network-hardware, he can
use your software if he writes a driver for it? Sound good...

I would suggest that you power one of those PC cooling fans with a "wall wart" power supply rather than opening the 1050. Moving the air around the drive will do the job just as well. Some of the 1050s have bad or undersized capacitors in their voltage doubler circuits. This overheats the power rectifiers - just look for crispy PC board at the back of the board. Cooling fans are not the answer for this - you need to fix it.

That's not _hardware_ compatible. PBI-software won't work with MUX, since
the MUX is not a PBI device. MUX is also not hardware compatible with SIO,
therefore it needs a modified OS, so that SIO calls are redirected to MUX.

> > The Client/Server protocol I have in mind (and documented) can be

And when someone developes his own network-hardware, he can
> use your software if he writes a driver for it? Sound good...

Yes, that's about it. In fact the SIO command frame is used for the
communication, but since the software interface must go through CIO, other
hardware can make use of it by installing a handler. I don't know how MUX
handles non-standard SIO calls, but it could be that the same SIO2PC driver
works for the MUX because of the SIO redirection. Hm, interesting.

Freddy.

I mean, if I start-up a sector-editor and change the vectors in your PBI-driver to let them point to the cartridge-area where the
MUX is located, will it in theory work? (it's kind of hard to explain what I actually mean).

> > So, actually it'll be a sort of ASPI-layer, but for a network-device?

what I actually mean).

No, a PBI driver is a PBI driver, not a MUX driver. :)

The trick is CIO and device handler support in the OS. For example, I once made an A: handler supporting only a few CIO calls (e.g. Open, Close and Put). This worked very much like FILE2PC (from the SIO2PC software), but as a handler. So, in Sparta I could copy a file to A: and it went right to my PC harddisk through SIO2PC. With the right handler you can do the same with MUX or PBI.

What's more is that Sparta/BW-DOS have already defined CIO (or I should say XIO) commands for e.g. directory handling. The idea of Atari Client/Server is to make a transfer from CIO to SIO commands by installing a handler. You could call it a blown-up FILE2PC in a device handler.

To make it compatible with MUX (or PBI), you simply have to make a new handler supporting the low-level communication through MUX (or PBI).

> > > So, actually it'll be a sort of ASPI-layer, but for a network-device?
>
> > Yes, that's about it.
>
> Okay. Will it be finished this week? :-)))

The theory is pretty much finished. In practice I've been looking for someone doing low-level serial I/O coding on the PC side and recently found that person (Hi Matthias!). When the time is right (e.g. when the current project is finished) I will work on the Client/Server using SIO2PC.

Freddy.

Check out
http://www.atariarchives.org/oldhackers/

One of the very last OHAUG newsletters had a good article on this. It might also give you some alternative ideas if you don't like the author's mounting method.

As does MyDos, or does it take a different aproach to handle directories?

Hello
Few days ago I bought damaged ATARI XE Game System.Now I'm trying to fix it
:-) but what i found inside!? There are two 4416's instead 4464's,and I
think 4416's are damaged (they are getting HOT after few seconds :-)).
Somebody heard about XEGS with 16kB of RAM???
Greetings
Kamil

5308. ADV: New Atari 8-bit CD-ROM

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-08 18:54:43 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1034103439.36470.0@demeter.uk.clara.net>
Source record: 26979

Hello All,

I'm pleased to announce that my second CD-ROM of Atari 8-bit software is now available to buy. This CD contains:

* Print-Filer from Rambit
* Alien Blast from Richard Gore
* Demo Maker/Edit 7 from Richard Gore
* AMS 96 video in MPEG-1 format
* PD: Bash-A-Drum
* PD: Dean's Desktop System
* PD: Don't Ask Software Demo Disk
* PD: Education Disk 1
* PD: Football Fantasies
* PD: Journey Into Sound Demo Disk
* PD: Parrot Demo Disk
* PD: Programmer's Speech Tool
* PD: Quick Demo Disk
* PD: This & That Disks 1&2
* PD: Tiger Developments Demo Disk
* PD: Voicemaster Demo Disk

The cost of this CD is US$12 INCLUDING shipping. Or, you can buy it as a combo with the first CD (DGS/PPP products) for US$25 the set INCLUDING shipping.

To see more detailed info, and to order the CD, please visit http://www.dgs.clara.net and click the option for the 2nd CD-ROM.

Dean Garraghty

At least a different syntax. I'm nore sure about MyDOS. Don't know if it
should be supported.

Freddy.

I'm not a big fan of MyDos, but afaik it uses different XIO-command to handle directories then Sparta-Dos does...

Yes, I have that disk for my 800xl and 130XE. Right now, the disks loads for a while then stops. I am trying solve this problem. Nice program. On my 400 the sound comes right from the computer and not the TV.

I am pretty sure Midnight Magic appeared first on the Atari 8bit line
and other home computers of the day. The 2600 version came a good
while later (as late as 1987 or so).

The 2600 version was graphically excellent in terms of 2600 games.
They had perfected the "bank-switching" technique to squeeze more
stuff into 2600 games. The 2600 version of Midnight Magic is actually
quite remarkable, in a class with Pitfall II, Super Sprint, Ms. Pacman
and a few others.

Mine does this sometimes as well. I made a copy of it on my Happy about 8
years ago because I was afraid that it would stop working! Luckily it
hasn't.

Great game! (David's Midnight Magic) I even converted one of my broken
joysticks with two buttons to work with it. Much smoother gameplay using
two buttons than trying to use the joystick. In fact, you can raise both
flippers at the same time! Try that with a joystick, hehe.

I haven't seen a higher score on any of the images from the net than what I
have achieved (after about 10 years of playing off and on... more off than
on I guess.)

Here's mine: Boot Factory - telnet://bfbbs.dtdns.net

You might want to get Tom Hunt's AT_TELNET program or Steve Tucker's ATS so
you can login from a PC in ATASCII

Indeed.

But As far I can see now... there's not such a great pinball on atari XL/XE. Ofcoz' that david midnights magic program is nice for the year it was made in (1982!)... but Xl/XE can do much more. Btw. It has such a typical brotherbund look (just like Choplifter, Lode Runner) ... in this high resolution dot gfx.

Does someone know another pinball for atari 8bit NOT made with Pinball Construction set?

Greets,
Marius

subLogic's Night Mission Pinball.

Those Broderbund games are all ports of the Apple versions. That means
280x192 artifacted graphics and a joy-buzzer for sound. At least they
redid the sound on those. "Snake Byte" used the 400/800 internal speaker
for instance.

Ok, looking through the MyDOS docs I see there are many differences indeed.
Then MyDOS might require a separate handler.

The idea is to make the CIO-SIO transfer as simple as possible, so that it
takes very little memory at the Atari side. In other words, the Server will
do all the work (that includes converting filenames, paths, etc.).

Freddy.

Are you running the thing with a real atari or on an emulator? Perhaps some keyboard combination might fail on an emulator?

I use MPT 2.4 s+ (running on My Dos)

On the real thing:

CTRL-TAB goes to the menuline on top of the screen
In that menuline: use arrows and return (and ESCape for leaving the menu and menuline)

TAB: switch between the windows. The window on the left is the track window. The patterns that are played together are printed on the same line (in the different columns ofcourse). Move the cursor with the arrows.

The window on the bottom of the screen is the instruments window. It is hard to explain HOW to edit an instrument. I think it is handy to load a working MPT file (first try to play around with MPT's that are NOT using samples) You can try your instrument by pressing the keys on the keyboard. the Z=C1 to P =E3. If you want to play around with HIGHER/LOWER tones, you should use up or down arrow.

The last window is important. That is the pattern editor. SHIFT arrow let you choose the instrument you want to use. You can use as much instruments in your pattern as you like. If you use more than one instrument in your pattern, it sounds much more profi. Again you should play on your keyboard to get the right tones in the pattern.
Arrows -> and -< switch to differnt patterns. Ctrl + Arrows switch the cursor in the Track Window.

This is all for now (I'm a little in a hurry, I have to go in a few minutes)

Try these things out, and play alot with it. You will find out things quick, because it is a very easy to use program.

Marius

From what I understand of the above, you want to directly acces the PC harddisk (or a feature to be able to) without using
diskimages as used with SIO2PC / XFormer, right?
If this is the case, how are you going to solve the "max-files-per-directory" limit of the current Atari DOS' ?

Message-ID: <1034202299.31112.0@doris.uk.clara.net>
Source record: 26852

Hello All,

You may have seen from my posts over the last couple of days that I have released a second CD-ROM of Atari 8-bit products. So far, this has sold a massive TWO copies! The first CD staggered to 18 copies, which was below the target break-even point, but I still decided to do a second one. I appreciate that this new CD doesn't contain as much as the first, but it's still quality stuff. I also appreciate that the cost is only $3 less than the first, but the reasons for this are that the basic fixed costs of production and shipping are the same, and on this one I have to pay per-copy royalties. The bulk of the CD is taken over by the AMS 96 video, which is the first time this video has been available outside of the UK, largely because the original VHS copies were only available in PAL format. It's a great chance to see some of the people involved with the Atari in the UK. If you haven't done so already, please visit the site at http://www.dgs.clara.net and have a look at the CD info and consider ordering a copy. You can order using your credit cards. At the end of the day, if I were looking to become rich from this I wouldn't be doing it!! I've done these CDs to allow what's left of the Atari 8-bit community to own some high quality non-US software products at a reasonable price.

Thanks,
Dean Garraghty

At one point, I had a problem with 4 keys not working on my 800XL. Took the keyboard from a 600XL and simply replaced the not so functional one. It would be more of a last chance solution if you were unable to get one or more keys working but sometimes it's easier to find an old atari xl as opposed to the hassles of trying to fix a single key.

Glad you got yours working. See if you can find a spare 600xl or 800xl just incase the keyboard fails one day and you'll have a usable replacement. :)

Cheers!

- Shangrila

Not when it's been done on it's old adversaries already.

I ran several emulators for machines I used to have out of nostalgia. It
was neat, at first. Then I noticed how small the display was, how bad the
graphics looked and how many features the old software *didn't* have and
deleted the damn things.

My experience with groovyfun is just the opposite of yours. I
bought a Commodore telephone from her a few days ago. Good
communication,
fairly prompt shipping, well-wrapped package, product in very good
condition and in working order. Nice!

> She's also the type of Ebay seller that won't post feedback when you
> pay her, she waits until you give her feedback, so she can give you
> negative if you give her negative.

Just the opposite again... she left me positive feedback before I
even received the C= phone.

Howdy folks

I've stumbled into a problem and I hope you guys and girls can help me.

There can be a lot of directories with a lot of entries on a data CD, so I decided I need to load this still into a string instead of using the system I'm using with CD Audio Player.

Problem is, how do I put part of the string on part of the screen (preferably in TurboBASIC). The string will also contain other data, like 'file or dir flag', parent directory, size, etc..

Second problem, I need to copy lots of stuff (like 2048 bytes at a time) from one string to the next (in need one string as a buffer. the buffer is updated with every access to the CD ROM mech. If I do not use a string as a buffer, TurboBASIC doesn't know I'm using this memory as a buffer. TurboBASIC seems to be very slow at this, but maybe I'm doing something wrong, I'm no expert.

I should inform you that I am already using page 6 to hold the SCSI commands.

CU Mathy van Nisselroy

Howdy folks

Tom Hunt has a lot of InfoCOM games that never appeared commercially for the Atari 8 bit on his site. Seems like InfoCOm used some kind of standard language to write these adventures in and the run tghem thrue an interpreter to turn them into code the different computers could read. Tom has recreated this language for the 8 bit Atari and has converted many of these adventures. Maybe they cold be put on a cartridge with a nice menu program to select the individual adventures.

I don't get exactly what you want to do... And my answers are SO simple,
that I cannot imagine this is the information you wanted to know

If every enty in a dir is 11 characters, you can use this form I guess?

string$(x,x+10) for your dir... in which x is 0, 11, 22 etc.
PRINT STRING$(11,11+10) shows entry two of the dir in STRING$ on your
screen.

Btw. Why don't you use a reserved part of memory in Turbo Basic for
buffering? You can protect memory by lowering the memtop (like it is done
with PM graphics in Basic too)

For copying 2k bytes I suggest you write a simple assembly routine and put
it on a safe place in memory. (Protect memory again!)

and with the USR command you can use your routine. Btw. with USR you can
give parameters too, might be handy.

Don't forget to start your routine with PLA.

I guess you use Turbo Basic with (My)dos. In that case you can use Bload to
load your m/l routine. Perhaps you can disasemble your ml routine into DATA
lines. If you are using tbasic with spartados, use the xio commands for
binary load (but I can't imagine YOU use Sparta)

Howdy folks

Does anybody know if the CD identifier for CDI is spelled CDI, CD-I or CD_I
(on the disk in sector number 16)

CU Mathy van Nisselroy

As Marius says, a machine code routine can do the trick.
If you send me the TB version, I can write the assem. code.

Freddy.

<SNIP>

Old school game play Enthusiasts write new games for ancient machines
By David Kushner
New York Times

Once a year Malte Mundt and his friends in Hamburg, Germany, party like it's 1982. That's the year the Commodore 64 hit the shelves, and Mundt and the other self-described C64 freaks stage an annual bash to celebrate their beloved, obsolete computers.

5351. Ebay advice needed from fellow Atarians please!

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-10 15:03:14 UTC
From: dunxuk@aol.com
Message-ID: <20021010110314.25399.00000748@mb-mv.aol.com>
Source record: 26872

I need some advice from experienced eBayers in the Atari newsgroup! I'm not wet behind the ears but I need a second opinion...

Can someone please check the bid history for an auction I've just won and tell me if I've been shilled?

The link is
http://cgi6.ebay.co.uk/aw-cgi/eBayISAPI.dll?ViewBids&item=1384728747

The seller insists I pay but I smell a rat on this one. Why would anyone overbid me to find my maximum bid, immediately retract it (twice!) and seconds later bid exactly the same amount as me?

TIA, Dunx

Hi,

Just add 2x 4464 chips or 44256 chips and a GAL if you have a 65XE/800XE.
With an 130XE just remove the 4464 chips replace them with 44256 chips and a
the nomal circuit for 8x1 chip...

1984 actually. The Atari XE cart came out in 1987 (although it was just
repackaging of the 1982 disk version of the game).

> keyboard from a 600XL and simply replaced the not so functional one.

Lucky you.
I had an 800XL of which 2 keys did not work. While opening the system I saw the previous owner also had some keyboard-problems in
the past, as some wires ran directly from the keyboard-PCB to the main-PCB to avoid the use of the probably bad keyboard-connector
on the main-PCB. I totally restored the connector and took another keyboard from a dead 600XL, to discover this one had 9 broken
keys :-)

The 800XL was quickly converted into four 600XL's. (deviding an 800XL PCB into 4 pieces will make four 16KB boards. Not?)

Message-ID: <3da6589e$0$1460$272ea4a1@news.execpc.com>
Source record: 26884

We're cleaning the basement.
I tried my 1020 and it just can't quite do the init
of the four pens, doesn't rotate to black, the other
three colors make their squares at init.
The 1020 never was a very good machine, but cute
anyway. I do have 6 pens that still work.
I should also toss my first printer, a 1027. Getting
a roller for it, well, I might put WD40 on the old one.

There's a suspicious look to it. Finding your high
bid would be the purpose. A lot of 'b's in the
seller and the bid retractor. Bidding on your own
items is against e-bay, I'm sure. But it shouldn't be
hard to do. Maybe you've been shilled by a second
party, but it could be done all by the seller with
two accounts.
If you don't trust the seller (has sold a fair amount, check
the feedback), you can withdraw your buy, and take
the heat, but give an explanation.
You have to use your intuition with sellers. I saw
one guy trying to sell really weird URLs for like
1000 dollars, somehow reminded me of Terry Ortman.
(Remember Terry Ortman?).

Scam alert! Seller and other two bidders know each other via feedback
ratings links, check them out. All post postive feedback to each other,
so I can't explain 'told not to bid on my items' comment. Report them
all to ebay first and tell ebay you don't intend to pay as it seems like
a scam to you. I'd also not spend that much for such a system, but I'm
not on that side of the pond - I don't know what the going rate is over
there.

>I'd also not spend that much for such a system, but I'm
>not on that side of the pond - I don't know what the going rate is over
>there.

They are rare (=pricey) over here mainly due to Atari's ridiculous pricing
policy that made everyone buy C64s instead. ï¿½50 for a 130XE + 1050 Disk Drive +
lots of disks is a reasonable price.

I've informed eBay and he can whistle for his money.

Many thanks everyone!

Duncan

hi,
the difference between the broderbund and atari versions of midnight magic are that broderbund used a paddle controller scheme, one paddle for each hand allowed for a true feel of flipper buttons just like the real thing.
atari used a terrible joystick scheme that really cut down on the game play.
atari actualy had both ready for a cart, but chose the joystick one instead.
thanks,
lance

Source record: 26896

Hello Freddy,
I am in good contact to Jiri Bernasek via snail-mail. And I sort of quoted one of his letters, where he really wrote, that he has no motivation to update or upgrade Bewe-DOS any further. Maybe I should give you some background: I am not at all a programmer, thats true. So, last year at the Unconventional I gave away an Atari 65XE with built-in My-IDE interface and an XF floppy drive (with 3,5" floppy) plus lots of Software to some of Jiri`s friends. Since jiri wasn`t there personally, they later gave him all these things. I did not want any money for these items, instead I wanted Jiri to program something for me. Since I gave him two hardware items (a computer+IDE interface, a 3,5" floppy), I therefore wanted him to program/update two things for me: a) update Bewe-DOS for 8 (or 9) drives and HD/HDD support, b) program something for the multilink/gamelink-2 device including a documented source-code.

Well, he fullfilled my second wish - he programmed 2 games (multi-race and multi-worms), included a well-documented source-code for multi-worms and even did a (programming-) module that can be used in other (self-written) games, that should use the multilink device. So, here I was very happy! But, concerning my first wish, he told me that he has no motivations to upgrade or update Bewe-DOS any further, he likes it the way it is. furthermore he told me, that he soon would have problems concerning the memlo (that should stay below $2000) and maybe other things. Hey, my post was not meant as a complaint, just a reminder, that I already asked Jiri to update Bewe-DOS, but he replied that he won`t do it...

Of course I am proud of all the things, Jiri already did for the Atari community (not only for the ABBUC - but for the whole Atari communtity). thats why I contacted him and gave him some of my atari hardware for free! Hopefully this is clear now - greetings, Andreas.

P.S.: If you are interested, I can do some copies of Jiri`s letters and bring them to the ABBUC JHV (if you are there)... the last letter arrived in July 2002 !!

Well,
sorry I also do not have any schematics... thats why I (re-) printed
some of Stefan dorndorfs letters in various ABBUC magazines. this guy
has a lot of ideas (and always knows where to find the hardware) - but
he never gave me any precise descriptions or manuals nor schematics...
Maybe with the help of these articles in abbuc mag. (hoping that other
atarians are also interested) we can change this. Or we can talk about
that stuff at the ABBUC JHV, since Stefan will be there again this year
(he has told my friend T.Schall)... -Andreas.

Nope,
the guys from ARGS used a "standard" 8Mhz controller instead and merely
thought about a 16Mhz / HD floppy drive... Besides that, this regional
group does not exist anymore! They have broken up some years ago (they
wrote this in an older abbuc magazine)... -Andreas.

Well,
if you don`t find a use for (small) 3,5" drives - how do you find a use
for much bigger harddisk drives ?!? I guess, some Atarians would be
satisfied if they merely could get some 3,5" drives and thus eliminating
the 5,25" problems (where to get or find 5,25" DD-disks, etc.). Besides,
1440kbytes is quite some space... -Andreas.

In article <anqa49$bm7$1@news1.xs4all.nl>, TXG <txg@the-
underground.myweb.nl> writes
>Hi,
>
>Does someone have a copy of ULTRACOPY 1.1? I had one but it's not working
>anymore..

Hmmm ... Now is that the disk copier I wrote in the mid 80s? - plain
black background, written to allow US doubler equipped drives to read
standard disks in US doubler mode.

If it is then I don't have the 1.1 version but I do have the 2.3
version. If that sounds like it then I've uploaded an XFD image at
http://www.djfirth.ukshells.co.uk/sample.xfd

I've still got the M65 source code - if anyone wants a copy then let me
know.

Regards

Well,
there`s that sublogic pinball, I don`t remember the name of... then
there is a pinball made by codemasters (gr. 15, 4 colors). but afaik,
all the rest were made with PCS (I collected approx. 80 of these PCS
pinballs). But in my eyes most Atari 8bit pinballs are really boring -
this has to do with their age. in the early 80s many effects, known from
modern pinballs were simply not available in the arcades. the same
counts for the computer pinballs... -andreas.

Well,
afaik MC and Slime are the only games that work with an original
trackball (in TB) mode. I never used a TB in TB or joystick mode - but
it can be converted to a mouse very easily and then you have dozens of
mouse games waiting for you. Even MC will work with a mouse (not sure
about slime)... -Andreas.

Message-ID: <3DA6FC58.FDC5182C@students.uni-mainz.de>
Source record: 26811

Well,
that was a bad choice, since the paddle version could also be played with joystick I think. In paddle mode you pressed the left paddle fire button for the left flipper and the right fire button for the right flipper. in joystick mode you could move left (= left paddle trigger button) to use the left flipper or move right (= right paddle fire buton) to move the right flipper. Thats what all PCS pinballs support. there is even a mode to use booth flippers in joystick mode simultanously: move left or right while pressing the joystick fire button at the same time (with paddles, press both paddle fire buttons, assuming you have a pair of paddles). Bad choice Atari ! Besides, the disk version of D.M.M. also contained some (intro-) sound, which the cart does not! Luckily I found that DMM sound in an old demo (with many ripped game sounds). -Andreas.

Inside a dustbin, yeah, could be, that's the reason of the dark humor for sure! ;-)

But ok, the reaction was based on a more serious thought. E.g. you could write in the newsgroup what the changes are in the ramdisk infos and point to a web-page? Or put everything in one text file and post it once a month. Really, I think it's good information. That's why I think it needs a web-site.

Best,
Freddy.

Hi Andreas,

Ok, it seems every respectful Atari user has good contact with Jiri. I have to admit that my last letter to him was probably somewhere in 2001, so I can't say I'm currently in good contact.
Still, I consider him as one of my close friends who's very productive in the Atari 'scene'.

The background I know about is that he had a lot of fun making BW-DOS, until the point that he had only time to do updates because people requested it. So, I can imagine that something fun seems to turn into a 'job' (without payment). Don't forget this is all a hobby! We can not expect things, just be happy with the things people are doing or have done. Otherwise we should simply pay for it, but when you get paid it's not a hobby and probably less fun because of the obligation to deliver.

Also, programming is a little like art, you should not enforce it. :)

Actually, if I got an 65XE with all the stuff you mentioned and was asked to deliver a well-documented multi-link game, I would not accept. Sounds a little like, I give you a box of tools, now please deliver a well-build house for me. It simply doesn't work like that.

In my next letter to Jiri I will warn him for deals like that. He doesn't deserve to be treated like a cheap worker. He should keep the freedom of developing things _he_ likes to build.

Freddy.

P.S. His letters are no signed contracts. I don't have the need to see those.

I have not done it, *but* all of those old Analog and Antic project articles certainly implied the probability if you achieve minimal signal loss in the cable. Might need to use a couple of pins from another port for the strobe and acknowledge so your software can control data flow.

All original Atari disk software is on 5.25, so I can find a use for a 5.25
drive.
Data storage and backup can be done through SIO2PC directly to the HD. If
you want to exchange data with a friend, you probably need a 5.25, or that
friend must have a 3.5 also. There is a good chance the friend has a 3.5
inside his PC. So, put the stuff in a ZIP file on a 3.5 and you're done. :-)

Freddy.

Hello Freddy,
regarding your name, it might be that you live in some XE computers or some uncommon 800XLF computers?!? Ok, enough of that crap. I can write the Ramdisk infos as one text. but: afaik Michael Current uses these texts in 3 separate paragraphs (3.7, 8.12 and 8.13) in his A8FAQ. I am not sure if he would be happy, if I send all the stuff in one big text... let`s wait and see what he thinks of it.

Hmm, a homepage - a good idea. Did I mention, that I am not a programmer ?!? Ok, there are some programs that generate ready-to-use homepages, but I have my doubts, these programs would work on my old 486 (66Mhz) PC under DOS. so, someone would have to do this for me. I can support ASCII, RTF and Word6 text format - but as of yet I cannot support HTML in any way (my PC even cannot read HTML!). If you or somebody else are/is willing to do so, let me know and I send you all the stuff. I also want(ed) to give these texts to ABBUC, unfortunately wolfgang burger wants to have everything in german language and now I am much to lazy to translate it back again (I already had to translate it / write it in english)... -Andreas.

Ah,
now I see what you mean. It s exactly the reason why I gave my 3,5"
drives away. I did not use them very often and all the stuff I got for
the A8 was a) on 3,5" PC disks or b) 5,25" Atari disks. so there was
really no need for me for an XF351... -Andreas.

Well,
I believe all Atarians (humans) were killed sooner or later by Space Invaders, Galaxians or robots (like those in Berzerk or Robotron). "Humanoid(s) must not escape!" and other nice Berzerk samples come to mind... Game over for Atarians means game over for mankind (thats what the docs of many atari games say - and as said before, sooner or later you are defeated and thus GAME OVER!). Well, thinking of that we/mankind must have died quite often... (Don`t take it serious of course...) -Andreas.

Just installed a Happy Upgrade in a 1050. The disk drive power led lights, the drive busy light comes on, and the drive spins for a short while and then stops, the drive busy light goes out. Normal so far, but then it cycles through this again, i.e. the drive busy light comes on, the drive spins a little and stops, the drive busy light goes off. How can I fix this?
-Rick

I can't see a need for a web browser on the A8 (except for the cool factor)
but I can see the logic in coding an ftp client, or a simple SMB
client/server for some ethernet hardware / tcpip software.

Make sure you don't read anything extra into this. Lance of Video 61 is a friend and a friend to the Atari 8'tters. I am not angre with him or anyone else for that matter. Lance sell products that I have written and in some cases owns the product out right, BBS Express Professional for example. He is where I would go to get equipment. Lance and I have spoken on getting some utility software out to the Atari community. I have complete source for bbs express pro, Express Cart, SpartaDos x3.2 x3.3abc. Right Now two programmers are working on a new cli dos, Beta testers are setting up equipment at there expense to test. Tom Hunt has made source code aviable to me for REAL.DOS at no cost. Lance has offered to help with real.dos knowing that it will carry my Copyright and it will be published $hareware. So go on and be MAD the rest of us are going to make a KICKASS dos to support our hardware. And personaly I think you need to rethink your delima. Mike Holman really hurt The Atari Community but I am not going to let it slow me down a bit. And if you are still mad well I will just say a pray for you.

Before I stopped hacking Atari, one of the things I wanted to do was hack a 1020 for controlling heavy equipment.

The stepper motors in the 1020 are real standard affairs, just 6 wire types. The input is directly driven from ~the same multiple transistor on a chip used in the 1050 for buffering I/O signals. One level of bufferring and they could have driven some serious stepper motors.

Would have been cool to issue a series of drawto commands to the printer that would have cut your lawn in a crop circle type pattern or maybe machined a bottle opener on a home brew numerically controlled mill.

Stephen,
I'm not mad, just a little confused is all. I've heard from Lance
from Video 61 myself and he pretty much explained to me the whole
thing, just as you did. As I was myself trying to obtain the source
code & permission to use BBS Express Pro & SpartaDOS in the operating
system that I am working on (http://geocities.com/rtdos/rtdoshlp.zip
or http://groups.yahoo.com/group/rtdos). I'm just now becoming
familiar with REAL.DOS and have conversed with Tom Hunt over the last
several years (although I've now just started communitcating with him
recently after a couple year lapse).

Now, how do I obtain the source code to BBS Express Pro & SpartaDOS
and whose permission do I need to use it in rtdos ?

Andreas Magenheimer <magea000@students.uni-mainz.de> wrote:

> I can write
> the Ramdisk infos as one text. but: afaik Michael Current uses these
> texts in 3 separate paragraphs (3.7, 8.12 and 8.13) in his A8FAQ. I am
> not sure if he would be happy, if I send all the stuff in one big
> text... let`s wait and see what he thinks of it.

The RAMdisk stuff has been going into the FAQ, making it already available on
the web:

http://www.faqs.org/faqs/atari-8-bit/faq/section-24.html
http://www.faqs.org/faqs/atari-8-bit/faq/section-54.html
http://www.faqs.org/faqs/atari-8-bit/faq/section-55.html
the FAQ web home: http://www.faqs.org/faqs/atari-8-bit/faq/preamble.html

If people are getting tired of the monthly "ramdisk spam" Andreas could just
email updated versions to me, to be incorporated into the next posting of the
FAQ.

If people prefer Andreas to post new versions of the ramdisk info to the
newsgroup directly, but in one message rather than 3, I could deal with that
too.

I guess I don't really have a preference. It's just great that the information
is getting collected, and I'm happy to include it in the FAQ.

Check out http://c64.cc65.org/ for some fun. The C64 guys are
way ahead on this one... but nothing there that the A8 can't do!

AFAIK the TCP/IP stack (http://dunkels.com/adam/uip/)
is working fine on the A8 thanks to Christian Groessler.

Also, EmbdeddedEthernet (http://www.embeddedethernet.com/)
is worth a look.

Regards,
Mark

Before I ask the question, a little background on what I want to do: I want my program to be able to load a configuration file for itself from the same device that the program is loading from. So if the user loads my program from say D3:, then the config file will also be loaded from D3: This has to work with all commonly used ATARI-8 DOSes (MyDOS, SpartaDOS, DOS 2.0/2.5), ramdisks and 'real' drives.

The question is:
What's the best way to determine the current device ID + number?

My initial thoughts are to get this info from ICHID (index into device name table) and ICDNO (device number) in the IOCB, by running the code in an INIT segment. Is this the best way of doing it? If so, is it safe to get these values directly from the ZIOCB (zero page copy of IOCB), or is there a better way to figure out which is the correct IOCB to use?

Raphael,

I'm also curious about a way to find out the default drive with DOS 2.0/2.5.

For Sparta and OS/A+ I've managed to do this, but for the Atari DOS I just use D1: as default.
I thought about peeking into the line input buffer (where the filename was typed), but that didn't work. The method using ZIOCB sounds good. Please let me know if it works! :)

If you like to see my code, it's in the getargs.s library module from the cc65 compiler.

Freddy.

At this time I have no direct support. So your favort ramdisk handler
will work. But that isn't to say it could not happen. Right now I
have a list of things that will be put into real dos and I don't want
to add anything more at this time. Bottom line is I want to have this
dos finished by March of 2003. If I added everying from the beginning
there is a longer testing peird and that will delay the first rev.
Then there will be time and we can add things from there.

Yes, It is a project. The more programmers we get involved will make
it go quicker. I hpe peolpe will program for it and post there
source however the source for the real.dos core will not be shared
execpt with programmer I have worked with and trust. I am not going
to have another occasion where a person steals my soure and then sells
it again.

Hello all,

The staff at Micro Mart want to run a feature over the 8 weeks running up to Christmas and New Year time (I think) which they are calling "The All Time Computer World Cup". The idea is 2 computers from the list below are paired up against each other, and someone who is passionate about a particular format (IE, Vic 20) tells the Micro Mart reader base why it is better than it's opponent (IE, Sinclair ZX81), or why it is generally a truely great computer, and then the readers vote somehow, and the winner goes through.

From this, Micro Mart readers will decide their "Best Ever" computer out of these sixteen; (In no particular order)

All Time Computer World Cup

1 Dragon 32
2 Commodore 64
3 ZX Spectrum
4 AMSTRAD PCW
5 AMSTRAD CPC
6 Atari ST
7 PC
8 Amiga
9 Apple Mac
10 BBC Micro
11 Oric Atmos
12 Atari XE/XL
13 ZX80/81
14 Sinclair QL
15 MSX
16 Vic 20

I will need someone who could argue the Atari's case etc... Please contact me for more information.

Shaun@MicroMart.co.uk

5426. hypram and mydos

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-13 11:39:12 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <aobm0oihe1@reader12.wxs.nl>
Source record: 26747

In the docs of HYRAM (JKP) i read this ramdisk driver should be used if you want to use your ramdisk without formatting with both Mydos and Spartados.

That is a very HANDY and fast way to exchange files between large partitions (mydos and sparta)

But now the problem. I can't get it worked.

I've tried different combinations. As far as I know I should use the build-in ramdisk from MyDOS. I'm using this on stock XE, so this is a 64KB ramdisk.

On spartados I type HYPRAM d8: /n
this results in a ramdisk with garbage

On spartados I type HYPRAM d8: /na
this results in a ramdisk with garbage on D9: (NINE YES!)

On spartados I type HYPRAM d8:
and format it with Xinit. Works fine, but in mydos the data is gone.

On spartados I type HYPRAM d8: /a
and try to formatthe D9: (yes NINE). but Xinit won't let me format d9:

In Mydos I can't start Hypram. It is loading, but doesn't work.

what am i doing wrong?

I've tried above with Spartados 3.2g and 3.3a. And I'm using MyDos 4.50 and 4.53/4

Greetz.

Marius

5427. 1050 blues

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-13 15:25:17 UTC
From: Richard Heldmann <rheldmann@rcn.com>
Message-ID: <aoc38rffg1@bob.news.rcn.net>
Source record: 26748

I bought two 1050's on Ebay, condition unknown. Both have US doubler clones installed. Both have write protect switches and leds installed. One works perfectly. The other one also has a switch on the rear which I thought might be a drive select switch, but it is not tied to the drive select circuit. It is tied to the write protect switch in the front. This one is DOA. The power led comes on, but the drive does not spin, nor does the busy light come on. I've swapped the drive mechanism, and it works in the other drive.

Where's a good place to start to fix this? Do I start with the 3086, or the 2793, or any other chip?
Besides the trash can.
Thanks,
Rick

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> 2793, or any other chip?

It helps if you report what noise it makes when you try to boot it with the computer with tv/monitor volume on.

If you get the standard noise like no drive attached then it could be just about any chip. If you get a different sound like some communication is taking place then usually it means all your chips are good and your 12 V supply is bad. The place where they usually fail is the voltage doubler circuits, speciffically the two diodes located between the tall caps at the back of the board break loose from thermal cycling.

Does anyone remeber this Atari 800XL BBS in Nor. California?

I was an Atari 800XL with 256k Rambo Chip, 4 "happy" drives, 300 baud MPP modem, then later a 1200 Avatex (Avatar) modem. Ran 3 BBS programs, first one I forgot, but was similar to Atari Junction in Fairfield at the Time (Travis AFB), next was Carina BBS, then finaly Oasis BBS.

I was hoping to get some Atari-toons that were created on that BBS or some old screen shots.

Good board back in the day.

Man, its been a long time since I did that. As I recall, I had a level II
or III Z-Code interpreter for the A8-bit. Then I used the version 5 Inform
compiler to compile some of the newer games written by people that released
their source code. I also recall that some of Infocom games were never
released for the A8, but actually could be if they were combined with the
proper A8 Zcode interpreter. Although I no longer have access to the tools
I used for doing that, I can say that there could be quit a few new
"Infocom style", Inform compiled games created for the A8-bit that are not
currently available for it. All of the required information to do so is
still out on the net. If only some enterprising A8-bit user would do so.
I'd be willing to give advice from foggy memory to someone to do so, if
they are good with 65C02
assembly, A8 direct sector access methods, object oriented programming
familiarity (for the Inform programming language), and are confortable with
CC65. I mention this because I don't want to get email from neophyte
programmers that want to do this but really do not possess the skills.

>What was the outcome on this Dunx?

Chris is still demanding his money and cannot see any possible reason why I shouldn't pay him the full whack.

Ebay suspended the two bidders that shilled the deal but they explain that unless they can absolutely prove a link there is nothing they can do except keep track of complaints.

It would be wise to be wary of strange bid retractions when dealing with this customer - I see no logical reason why someone would shill auctions just for the sake of it.

Thanks for asking, still waiting for a further reply from eBay!

Dunx

BTW If anyone is looking for a /seriously/ large collections of Atari floppies (hundreds and hundreds) and they are in the UK then keep an eye out for them in the next month or so! ;o)

Hmm. My feelings (and they are Just that)

Apple Mac, QL, Amiga and ST are all 68000 machines and are far superior to all the others.

Vic 20 and ZX80/81, along with the unlisted Acorn Atom all belong to the entusiasts machines of 1980-82. All usualy lacked memory (all under 16 k built in), power and display. Its my feeling that the Atom was actauly the better of these machines.

Generaly, The 6502 machines had an edge on the Z80 based machines.

I'm curious as to the lack Apple 2. The Atari 800 set the standard, but at a price. The Commodore 64 brought that power in at a much lower price some time later. Not much between them, the C64 having superior (just) sound, slightly inferior (just) display. repuditly klunky basic. Once the C64 arrived, machines of a simmilar price like the Dragon and the TI/99 series were blown out of the water. The BBC should have in theory followed them but for the BBC contract with its school purchases that followed which kept it going. Not a bad machine, but somehow seemed to be artificialy preserved by the BBC and the UK education sysytem.

Its not that these machines were particularly bad, much better than the enthusiasts machines, but lacking the power to compete directly with the C64 and Atari 800.

The XL/XE series brought the Atari machine into competition again (price wise), and it could hold its own Vs all commers (like the c64 and the MSX) in such a way as your choice of machine could come down to personal taste.

The MSX may have been much better but it came to late to grab a useful market share.

The Oric was better than the spectrum, but hampered by a icky and over-stylized calculator keyboard and being £10 more that the equivelent spectrum. The Atmos was much better (certainly corrected the keyboard) but built on the reletive faliure of the original so never caught on.

Amstrad CPC was a triumph of marketing that broke into the apparently settled and sealed Spectrum/Commodore market which was guided by price as to who bought which.

The PCW series seems more at home amongst the 68000 machines, but was after an entierly different market so little worthwhile comparison can be made.

Of the 68000 machines the commodore amiga i feel was superior, Atari this turn under cut it with price of the remarkably simmilar ST, The QL was a

brave try released unfinished and sunk accordingly. The Mac, that matured later, much later.

Hi Mirko;

This looks like we are working with a GR.0 screen and copying rectangles of text from a 'work' area into the display RAM. Can we assume that X and BYTES are 0-39 and that Y and LINES are 0-23 or at least require a single byte in the range less than 255?

This routine would be simpler in fixed address code using some JSRs, but can be accomplished in a relocatable string with a bit of creativity. I would put the indirect indexed stuff in the floating point registers FR0-FR1 since the routine is stand alone and reset with each USR call.

It looks more to a GR.8 (24) routine to me. By adding 320 you get the bytes from 8 scan lines below, so the routine 'moves' a window 8 lines up on the screen. There will be a problem when the window is on the bottom of the screen, since then it gets out of screen ram by the +320.

Mirko, please explain what the routine should do, so we can make correct code.

Freddy.

Obviously you can't prove it but it is very strange that the bidder in
question has done this before and there only seems one logical reason:
to drive the price up.

In the same way that the Morris Ital is far superior to the Morris Minor. Guess which one I'd rather drive today!

When you take into account the year that these machines were released there is one clear winner.

Nice points you make though, except for the Acorn Atom which really was a dog, its only saving grace was the most stunningly unplayably hard clone of Galaxians to grace any system ever.

Ah...if only.

Thanks for taking the time out of your busy life to dash off that response.
Your support of this community helps keep it vibrant and vivacious, even in
the face of such blatant and rampant laziness. I hope the original poster
is duly chastised and in the future will learn all things about the subject
at hand before posting a question regarding said subject.

Have you configured it to autoboot into Atari DOS or anything? That would be interesting. In other words make the emulation transparent, as if it were an actual 8bit.

Would I be swayed by such an argument as an irritatingly good game ;0)

Could be.

I think the strength in the 8 Bit Atari was that the design team took the chip and asked them selves 'what can we squeeze out of this'. Rather than being told 'your end result must only cost this much'. Hense 8 years later it was still competetive with its newer younger rivals.
That they did the same with the Amiga (many of the same people on both teams) which help explains the Amiga's longevity as well. But as the easter egg said, shame about commodores input! ;0)

I ran across something that was very helpful, so thought I'd post it. While reading through some docs for some old hardware that supplied a "doughnut" torroid with the system, it suggested (1) 5 loops (no more/no less) and (2) placing the torroid as close as possible the "TV". In my case, the "TV' is the Video Card input on my PC. I can't do the 5 loops, but by moving my clip-on torroid right next to the PC card input from further away, the picture was cleaned up again quite significantly. It is now *almost* as clean as the PC display with only an occasional vestiage of pulsing or flicker. But there are still a few things to try...

I've just been thinking (oh-oh). It would be real nice for it to have an external command.com . That way it could be installed with a DOS style command processor, Unix (bash, csh, ksh, borne) shell style command processor, or even replaced with an Atari-DOS/MyDOS style DUP menu (yuk). Doing this would pull in the widest range of users.

Make it so that:

1 The MEMLO is automatically set to the <end> of where command.com loads.
2 MEMLO could optionally be set to the <beginning> command.com load address. This would work great for some things, but not interrupt driven code because when command.com reloads it could get messy. So, have it default to set MEMLO to the end of the command.com code with an option to let the user set the MEMLO to the start of command.com. This way when command.com is exited the user can use that memory.

Have both an overlay and partial overlay vector so that command.com can be called from within an application and afterwords the app would resume. Snapshotting could also be employed for the same effect, but a reserved block of memory for passing parameters would need to be reserved. ASCII text (batch commands) would take more room to pass, as compared to a command frame buffer. The CFB would be a tokenized representation of the parameters passed to command.com in the 2nd snapshot. A return parameter memory block would need to be reserved as well.

Command.com and other CMDs could also be stored in the extended ram banks and run directly from there instead of downloading them in to main memory as necessary. To mix & match the loading of these CMDs in to the extended ram banks a memory management system would need to be worked out, and the CMDs would have to abide by it (no ZP ram usage, only localized ram usage, etc.).

Also, have an option for a "safe mode" boot. If a user totally hoses up their configuration they can still boot in to safe mode and fix it. Perhaps this safe mode could be detected on one or more of the console keys being pressed?

Just Some Thoughts,
Tom

That is exactly what I did! Now, I'm just looking for more stuff to
put on the hd, such as the Antic & ANALOG collections. (or even
compute). I want to max out this hd.

I used DOS 6.22 but stripped it of un-necessary stuff such as QBASIC
some of the drivers, etc. I've got about 30 to 35 percent free space
on the hd.

Sure, the Windows based emulators are great, but when you can do
something like this with a DOS based emulator, man its awesome!

I've used both. Both are good / flexible operating systems for their respective machines. Opinions? Has anyone used both ? Which do you prefer and why?

(just doing a little research for rtdos)

I'm not familiar with Sparta DOS X but I know OS9 (level I & II). I used to work with a Gimix Ghost and I have 3 ST2900's that run RS OS9 Level I (and I have a few OS9 68K boxen). I love working with OS9 it has a lot of power in such a small package. I can run 2 users on a 6809 system (2Mhz parts) with no real problems. I kind of doubt that it would be as easy on the 6502. BTW, the Ghost ran 8 users. We used it for developement. It could handle 2 compiles and an assembly before the system would bog down noticeably. It's what got me started towards Unix & Linux.

Well, Freddy; that does sound more like what Mirko would be doing.

I had relocatable code down to 112 bytes using single byte arguments and no limit checks on edge of screen stuff. Need to establish our environment before before we debug and verify functionality and optimize size and flow...

There are a couple of 'Robot' articles in Antic on Kevin's
atarimagazines.com site and the printer interface in Analog
http://www.cyberroach.com/analog/an16/default.htm
which contain much of the technical info which can be adapted for your
project.

I would be *very* careful with the ground and other connections when going
direct PIA to PIA.

good idea tom. why not also add a back up config file so that every
time you make changes it automatically backs it up into, say
"CONFIG.BAK" (only one instance otherwise your drive my get full with
multiple copies) and then you can refer back to an earlier
configuration if changing some system settings hoses your system ?

just some random thoughts here:

combine SIO2PC / 1050-2-PC with the MIO or Black Box so that the PC could directly access atari hd (such as those used on the MIO) or something. can anyone see where I am leading ? hmmmm....just a thought.

The SIO2IDE already does this. Harddisks have to be prepared on PC. What for the Atari is a harddisks-partition, is an ATR when
connected to a PC system.

It's a long story. The problem is fixed now.

I'm a regular in another group and responsible for posting the FAQ for that group. When the other regulars didn't see that on the appointed day and didn't hear from me for a few days, they began to post messages asking if I was OK, or if anyone had heard from me. I also posted some messages with attached files and nobody thanked me for them.

Then I logged in here, where some of the guys know me and tried a test message, asking for replies. None were forthcoming.

My ISP worked for a few days on it and it's fixed now, but don't ask me what happened. I don't know, except that they found the problem faster when at least one of their other customers had the same complaint.

Thanks for asking. I know it kind of sounded like I was losing my mind :-)

Take care.

Alan

Hello all,

The staff at Micro Mart want to run a feature over the 8 weeks running up to Christmas and New Year time (I think) which they are calling "The All Time Computer World Cup". The idea is 2 computers from the list below are paired up against each other, and someone who is passionate about a particular format (IE, Vic 20) tells the Micro Mart reader base why it is better than it's opponent (IE, Sinclair ZX81), or why it is generally a truely great computer, and then the readers vote somehow, and the winner goes through.

From this, Micro Mart readers will decide their "Best Ever" computer out of these sixteen; (In no particular order)

All Time Computer World Cup

1 Dragon 32
2 Commodore 64
3 ZX Spectrum
4 AMSTRAD PCW
5 AMSTRAD CPC
6 Atari ST
7 PC
8 Amiga
9 Apple Mac
10 BBC Micro
11 Oric Atmos
12 Atari XE/XL
13 ZX80/81
14 Sinclair QL
15 MSX
16 Vic/Vc 20

I will need someone who could argue the case for any of the listed formats. Please contact me for more information.

Shaun@MicroMart.co.uk
http://www.micromart.co.uk

Also, Simon should be able to tell you more about this feature

TheEditor@MicroMart.co.uk

Shaun.

news:<a9758358.0210150628.11160efc@posting.google.com>...
> I stand corrected. But I was referring to a way to create blank disks
> through batch file that I can use with a DOS based emulator.
>

That's a little too much to ask for a batch file, maybe a
basic program would do better to create them from scratch.

What I would do is to store the main three types of blank xfd
disks into one cab file with M$'s cabarc.exe and then use
three different batch files to start up extract.exe to
restore the one wanted to the directory you were currently
in. Does that sound like something that would work for your
set up?

Each file thus created would have the same name, but you
could rename it as soon as it got extracted and then use it
by that new name from now on.

```
:: A90.bat
extract %winbootdir%\xfd.cab a90.xfd
cls
```

```
:: A130.bat
extract %winbootdir%\xfd.cab a130.xfd
cls
```

```
:: A180.bat
extract %winbootdir%\xfd.cab a180.xfd
cls
```

Would be the three batch files to use. They would go into a
directory in your path statement so that everything could be
found by DOS easily and the extracted xfd file should wind up
in your current directory. The %winbootdir% is used as an
example DOS enviroment variable only. On my system it works
fine, the xfd.cab file is in my Windows folder, and looking
at the DOS enviroment variables with the simple command
'set' shows that %winbootdir% equates to C:\Windows. But if
you don't have Windows installed on your DOS system then you
will have to define a specific location for the extract
program to find the xfd.cab file at by using the 'SET'
command in your autoexec.bat file to set the variable, in
this case a directory location. Or if you don't want to
bother with that just put the xfd.cab file in your root C:\

drive and subtitute 'C:' for the %winbootdir% above.

Now matter from what directory you type 'A180', for example, that's where the A180.xfd file pops up at. Xfd.cab was 854 bytes long in my test, super large xfd files would store with no real additional size cost, considering their expanded size.

Get cabarc.exe to make the cab file with here as M$ seems to want to deny that this program exists for download at their sites. A lotmore info than you need is also contained.

http://www.powerload.fsnet.co.uk/download/cab-sdk.exe

I'm not being picky but you should direct these messages to alt.test.

There are automatated servers dotted around the world that monitor alt.test and email you to let you know how your message progresses around the globe.

5498. Ultima IV quick question...

Newsgroup: comp.sys.atari.8bit

Anyone know what the order of the disks originally were, e.g. did disk 1 have Britannia on side 1 and Townes on side 2 etc...

Also were they all write-protected?

TIA, Dunx

<a9758358.0210151409.539846f0@posting.google.com>:

>why not also add a back up config file so that every
>time you make changes it automatically backs it up into, say
>"CONFIG.BAK"

I like that idea. One backup should be enough, but we could easily expand that to one automatic backup per day for 7 days. Sunday's backup might be 1.zip, Monday's would be 2.zip, etc. When next Sunday rolls around the 1st 1.zip gets overwritten, etc. A rolling 7 day backup.

On a different aspect, although I realize that this probably won't be in the stage-1 release, I'd like to see a robust automatic detection of a corrupt file system built in to it. Some A8-bit hard drive users hardly ever experienced a corrupt file system, while others experienced it much more often. Who knows why? Noisy cables, intermittant power supply fluctuations, could be anything. I envision this checking occuring in two areas: the first dealing with corrupted sector tables and the other dealing with actual corrupted files. Corrupted sector tables seem to occur when the hard drive mech <thinks> it is writing to a certain sector when in reality it is writing someplace else. This could be checked by maintaining two instances of these tables. When the DOS would read a sector table it would compare it to the copy and if they do not match, BINGO! The 2nd sector table would take up some room on the hard drive, but basically that is how UNIX does it. The second method would deal with corrupted files. This could be easily done by embeding a CRC-32 in to the program's header. Legacy A8 programs could be "wrapped" to accomodate this header by a special utility designed to do this.

Just some more thoughts to kick around,
Tom

If you had typed "atari sio2ide" in a searchengine like google, it would show you this one:

http://www.atari.cuprum.com.pl/sio2ide.htm

Unfortunately, it's written in Czech language, but you'll get the idea. I have one, but haven't got the change to try it cause I'm
moving in some weeks and everything is packed...

A.P.E. for MS-Dos is able to automaticly create an empty ATR image with use of BATch-file parameters. Don't know if the crippled
supports it, but it woks with the registered version...

5505. new discussion group for classic emulators

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-16 21:32:40 UTC
From: rtdos@rocketmail.com
Message-ID: <a9758358.0210161332.6d0a142b@posting.google.com>
Source record: 26726

I've created a general discussion group for classic emulators. The two reasons I am doing this is, one, to go along with my other group rtdos (http://geocities.com/rtdos & http://groups.yahoo.com/group/rtdos) and, two, not everyone has access to usenet (and if they do, they don't have access to usenet binaries). If you are a developer of an emulator or interested in non specific general emulators, then this group is for you. General emulators, such as M.A.M.E. & M.E.S.S. will be discussed as well as specific emulators for the Atari, Commodore, Apple, ti, Tandy, Timex, MSX, CPM, and other systems.

http://groups.yahoo.com/group/classicemulators

5506. Re: blank XFD or DCM disks

Message-ID: <n_kr9.40268$OB5.3053209@newsread2.prod.itd.earthlink.net>
Source record: 26727

Probably not... Ken wrote a Win9X utility that will display .XFD/.ATR
contents, view listed or Saved Basic files, hex dumps of .EXE files,
import/export of files with or w/o ascii/atascii translation. I will need to
find his site and see exactly what it was named as I renamed it...

You could probably also just copy one from Dos, load to emulator and delete
all files or re-format, rename it and use it as you will...

Subject: ADV: Bravo Sierra! Atari Sales, Support & Service!

Hi, I'm Ben Smith of Bravo Sierra Computers! Your Benefactor, an Atari
Dealer. Offering Sales, Support & Service of Atari HardWare, SoftWare,
Books & Accessories for the Classic Atari 8 Bit and Atari ST Computers
plus the 64 Bit Atari Jaguar Game System. I am a Reseller of Used & New
Atari Collections! Much of which were the Treasures of Former Atarians,
Locked away in Dungeons, now given New Lives, offered to be sold as New
found Treasure, back in Circulation in the Atari MarketPlace. Hidden and
Forgotten, Now set free from the secret hiding places. Atari Heaven where
former Atarians had left them to Die. Saving Wondrous Collections from
being irretrievably Lost! As well as Saving entire inventories from
defunct Atari Dealers, much of it +NEW in the BOX/BAG! After Languishing
in Forgotten Warehouses, long abandoned by retired Atari Dealers!

I love saving my customers money! I mainly use Postal Delivery! I save
money for my customers when using Postal 2-3 Day Priority Mail & Global
Priority Mail. I use Packaging supplied by the Post Office for free and
Pass on the savings. I sell Atari, I'm not in the Business of Profiting
from Marking up on the cost of Shipping! And just like the Postal Service
I avoid making promises I cant keep. The Post Office sends Packages by
2-3 Day Priority Mail. They don't promise 2-3 Days but they have a Good
record of Following through! Once I receive payment, your order usually
goes out the same Day! This is not a Promise, but like the Post Office I
have a Good record of following through! Ask my Customers! I also have
Libraries of Reference Books for the Classic Atari 8 Bit and the Atari ST
Computers! I have ways of saving Money on Postage by Sending it Book
Rate. I also have some tricks for saving on Postage when Mailing outside
the United States! I Ship Atari anywhere the Law allows! If you don't come
to me, I cant save you any Money!So check my HotLinks below, E-Mail me at
atari@aracnet.com or call Ben anytime at (503)256-9974! I'm not asking a
lot, I'm just trying to make a living and I'd like to earn your Business!

Got Atari Questions? E-Mail or Call Ben 24 Hrs, anytime at (503)256-9974!
http://www.aracnet.com/~atari/numbers.htm Phone contact info and Hours!

http://www.aracnet.com/~atari/catalogs.htm FREE Catalogs Download Area!

5524. Re: I need another assembler routine

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-17 19:48:20 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <8uEr9.41942$OB5.3216804@newsread2.prod.itd.earthlink.net>
Source record: 26745

It was the P*40 byte offset that led me astray; GR 8 squeezes 320 X
positions into the same 40 bytes as each mode line of GR 0.

Sounds like X can range 0-319 and Y as well as LINES could be up to 192.
Since BYTES is limited to 40, only X will require 2 bytes and the complexity
should not increase too much, hopefully.

BTW, moving mapped GR 8 text will involve some possible bit mangling on each
end of each scan line of bytes.

Also, what happens in the area below the last 8 scan lines which are moved
up? Surely we do not want to leave those 8 lines duplicated on screen...

Here is another A8 robotics page; it is mostly hardware...
http://vol.com/~infidel/halloween/atari800.html

You should check the joystick port interface in Analog 16 and study the software listing for how it uses strobe and acknowledge sending data to the printer. Using something similar on one A8 and a corresponding mirror image type on the other A8 could allow intercommunication between your Ataris.

I have the logic completed for all but:

converting X (0-319) to a byte value (0-39)
manipulating bits for partial byte moves
screen edge and bottom limit checks
those last 8 scanlines on the move up process

X will be a 2-byte vale, *but* the high byte is always '0' or '1' to
represent bit values from 0-319. We just divide X by 8 to locate the byte
offset and somehow extract bit offset from the remainder...

A Flame War??? I never knew giving an advise would be classified as "flame-war"...

The one and only thing I was writing was that you can save yourself lot's of time by just entering a few phrases in a searchengine
in stead of typing up a whole message and waiting for someone to answer it...

Yes, yes, I know now. You are the 5th one pointing it out to me :-)))

Just a typo. I actually know it's Polish. I even wrote down the Polish url (it's a.PL one, not a .CZ one :-))

Ron,

I don't think Mirko needs pixel aligned X values. So, IMO X could just be
0-39.
If it's really text scrolling he wants, then he will probably clear the top
part and place new text at the bottom area (in the case of up-scroll).

Ehm, it seems he needs crude window routines. I still need more info (partly
because I don't like to program without thinking about the design).

Freddy.

5534. SIO2IDE <--> ZIP Drive?

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-17 23:19:12 UTC
From: llpwhite@cs.com
Message-ID: <20021017191912.00241.00002519@mb-cf.news.cs.com>
Source record: 26605

Since the SIO2IDE stores info in PC format on the IDE device, seems like it would be useful (easier) to use a drive with removable media such as a ZIP Drive. 100 meg ZIPs are being "blown out" now that the 750 MB drives are out and are not backward compatible with the original 100 MB units (but are with the 250's, IIRC). IDE ZIPs are plenty fast. Anyone tried this or have some thoughts on the subject?
Larry

Great, not only do we get spammed by Bravo Stinko Computers,
now there is a copy-cat spammer. From what I've read, >50%
of the community is sick of this COMMERCIAL posting.

And yes, I know what a kill-file is.

Use it if the ad upsets you.

If 50% are sick of seeing it, 50% must be retarded for not knowing how to
either pass on by it or do a "Block Message".

I forgot to mention something. I not only need to copy it, I need to
convert it to ATASCII. It goes something like this:

1000 for x=1 to secsize
1010 a$(x,x)=chr$(peek(dbufr2+x))
1020 next x

I'm not sure it's exactly like this, I'll get back to you next week, but
it's used in DATA.21 on my homepage.

Hello Ken, Tom,

I don't have my Atari hardware any more, and I do all my 8-bitting in emulation. But I have to second the motion. That's the best idea I've heard in a long time.

Take care.

Alan

How to reed a simple dos 2.0 single density disk in bewedos. Bewedos seems to want only SPARTADOS or BEWEDOS formatted disks.

How to read / write a single dens. disk in bewedos.

spartados can read and write dos. 2.0s disks. So why can't bewedos?

Marius

Block the sender in your E mail reader and refrain from posting any
replies in the threads. Eventually it will die out.

I have bull shit Atari blocked as a sender; unfortunately, too many
people on this group reply on the group with complaints about the initial
poster, and all too frequently quote the initial post. If we would all each
exercise a little self restraint, it would die out.

Jim,

Here's a bit of history on Bravo Sierra ads.

Ben Smith was running an ad multiple times per month. (Some will say everyday. ???) He was just trying to do a little business with those wanting Atari Hardware and Software. I'd classify his business as a Profit making hobby using the internet as a means to reach customers.

Then a few readers felt they were going to do the world a service and at first publicly bad mouthed Ben for his ads. Ben avoided getting into a verbal exchange by ignoring slanderous posts. But this wasn't good enough for them, one or more went to Ben's I.P. and negotiated to have the I.P. threaten Ben with disconnection if Ben ran his ad more than once a month. So Ben is complying but his friends are running his ad for him.

I and others have taken it upon ourselves to ensure Ben's ads are still available for folks interested in Atari Software and Hardware.

Its unfortunate that the self appointed news group Police couldn't just use the "Block Sender" option. The N.G. Police made it worse not better for instead of just Ben running the ad, others are also now posting the ad. But the N.G.P. have the power to fix all of this by going back to the I.P. and have the disconnection threat rescinded. Then the only one posting Bravo Sierra ads would be Ben and those who didn't want to see the ad..... (use the shampoo ad...) "yes! Yes! YES!" I can use the "Block Sender" option.

I'll stop posting the Bravo Sierra ad when Ben requests me to stop.

Take care,

Don
Retired SysOp of the retired Bear Cavern BBS

Don Schmidt --

Your E mail to me was unsolicited and unwelcome. I really don't care
why you have decided to become a professional whore for Bravo Sierra
Computers.

Your E mail to me was, in my opinion, harassment for my posting information
on how to block unwanted commercial spam.

Your harassment has been reported to your ISP.

Do not E mail me again.

> to want only SPARTADOS or BEWEDOS formatted disks.

BeWeDos should be seen as a mini-Sparta-Dos replacement (or stripped down version or whatever). It takes up much less memory, so
it excludes some routines that are available in Sparta-Dos. One of the routines is the ablity to read/write DOS 2.x disks, which
can only be done when using the external utlility (menu.com?).

> How to read / write a single dens. disk in bewedos.

> spartados can read and write dos. 2.0s disks. So why can't bewedos?

Cause it only implements the Sparta-Dos filesystem routines, not the DOS 2.x ones.

Read again and learn to count. There are just a few (and always the same) people complaining over and over again about his "ADV:"
postings, but there are a lot more mails about the discussion "it's spam, it's not spam" then there are BS advertizings. You can
figure out by yourself what takes up more bandwidth, the "ADV's", or the "spam/not spam" mails...

> And yes, I know what a kill-file is.

Ever thought about using that feature?

To my good friend Jim:

You see Jim, spam is unsolicited correspondence to an e-mail address, not to a news group.

Your good friend Don
Retired SysOp of the retired Bear Cavern BBS.

P.S. You may be able to get, at very good prices, some of the ex-Bear Cavern BBS hardware and software at the Bravo Sierra store.

I remember SpartaDos did only read DOS 2.x Single Density, not Enhanced or?

Freddy.

I did not mean, when do the BS ads stop. I wondered when the threads on his ads stop!

Well, I guess this will always be the "Atari 8-bit, BS ads and the pro/anti-BS" newsgroup.

Freddy.

5555. Re: I need another assembler routine

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-18 21:01:32 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <ME_r9.1599$071.124836@newsread1.prod.itd.earthlink.net>
Source record: 26626

In this case, I may already have the MoveUp code done as my original assumptions were valid except for limits on 'Y' and 'LINES' which go from 23 to 192, *but* remain as a single byte and do not affect the logic.

Just to make certain we are on the same page:
'X' is byte position in GR 8 scan line, 0-38
'Y' is line position on GR 8 screen, 0-192
'LINES' is count of GR 8 lines to scroll, 0-192
'BYTES' is count of bytes per GR 8 line to move, 0-39
IE, routine moves a rectangular block that is 'BYTES' wide and 'LINES' scan lines tall begining at GR 8 position 8*'X', 'Y' up or down by 8 scan lines. Some other algorythm will check screen edge limits and clean up the 8 scan lines which are not overwritten.

Hi, Freddy;
That occurred to me overnight as the original TB statement is byte oriented
and would do any bit operations on that GR 8 screen.

Ver 1.1 maybe... I sure thought Sparta 2.3 and up could handle enhanced and
double.

You could convert the entire loop to a USR call:
Z=USR(ADR(ML$),ADR(A$),DBUFR2,SECSIZE)

Only question is details of atascii translation;
byte count change in CR LF --> EOL ?
replace code for ascii 0 to 31? Spaces or graphics char?

Sparta-Dos reads and writes Single and Double Density "DOS 2.x" without problems. It does definatley not _write_ to a DOS 2.x
Enhanced Density disk, but I'm not sure about _reading_ a disk in that format...

5563. Parrot sound interface

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-19 04:15:38 UTC
From: Russ Gilbert <russg@en.com>
Message-ID: <3db0dc66$0$17643$272ea4a1@news.execpc.com>
Source record: 26634

Somebody (Mathy I think) was asking about a
schematic for the Parrot interface. Actually
Tony (???) visits here, and I think he designed it.
You'd need the software for it, but I found my
drawing that Tom Hunt made.
It is a modified paddle controller.

```
mini jack
=----------------------
| |
| 2N2222 |
-|(----E B----------------------------
.1mf | C | |
50v | | O1meg pot |
| | | |
pin 9 |
jstick pt. pin7------VVV---------|--(-o )phono jack
100k
```

Uhm. I did that online. Prolly shoulda tried it in
a text editor. Just one cap, one resistor, a mini
jack for the microphone, a phono (RCA) for
a different microphone?, the cable to jstick port,
the pot and a 2N2222 transistor.

TONY RAMOS, right he posts here and could
tell you.

Spartados can't write the sectors above the 719 sectors of Dos 2.5 formatted (enhanced density) disks.

Btw. That enhanced format is extremely incompatible at all.

And the worst is: I have 2 1050's that are not able to read higher sectors too. They need to be tuned. The stupid part is they can read single dens disks without any repairment of the drive ;)

That was an INTERESTING REPLY FOX-1

If menu.com is able to read a dos 2.0s disk, might there be an external routine available to read those disks.

Why do I want to know this. Well I wrote a nice partition program for the My IDE interface. The program does almost the same as the Black Box menu but now for the My IDE interface you see.
My software uses an external PARTLIST.DAT file, but there we go. It isn't possible to read this partlist.dat from any other disk format then bewedos. But MYDOS won't read a BEWEDOS disk. So now I have to work with TWO partlist.dat files and that is very dangerous. Now the partition info table of the drive might get defect.

In a future (M/L code) version I'll write this partition list in a secret and safe place on the HD itself, so this program can be used in any dos. But now the thing is in Basic, so I need to read/write a single dens disk in Bewedos AND mydos.

Thanks
Marius

Adjusting the VCO (VC36) should fix the problem. Adj. to find center of the adjustment range that gives good reads.

You've got me confused somewhat, Paul. Are you suggesting that Ben is somehow associated with the 'FA - ebay #1234567' posters? If you knew Ben, the first thing you would know is that he objects in every way to ebay and its auctions. His distrust of ebay and its sellers is very obvious right from the start of any email discussions I've had with Ben.

I guess I need to you to translate 'his slam on auction sellers' into American english as that's the part that I can't get my head around right. I read - his outright, blatent, auction sellers. In which case, if true, see above paragraph? Its just my opinion but I think those 'FA ebay#1234567' posters are just background noise - they often are quite knowledgeable Atarians who are posting an SDX cart for sale or some other rare device. In which case, I consider it a good thing, as my collection of some of these rare items is not complete just yet. A couple of which, a Big D Astra and a 1200XL for $20 each came from Ben - beat that on ebay! He would make a lot more money if he used ebay, which I'm sure he and his 'cronies'(non-existant IMHO) do not. I'm pretty sure he is just a second hand store shopper who has quite a collection of Atari items finally, and would like to trade some of it for some money once in a while.

My complaint is about this page. I don't mind those that post "FA: blah"
ads, unless they are selling 50 items and post once for each item. Then I'd
prefer to see 1 post with 50 links.

paul gifford said,
Not entirely true. My beef was and is his slam on auction sellers. As
slanderous as any of the posts by others.
Paul

i cannot take this anymore. when ben told me that he was against
auctions i had two avenues of thought on this,
one is that every once in a while i do auctions, so did this enrage me
and turn me into a stark raving mad stalker that will hound ben to the
end of his life for voicing his constitutional rights of free speech?,
or would i take the second route that i thought he was wrong, then let
him know it and then i would go on with my life to other more important
aspects of life, which one do you think i took?
one good thing though has happened from this, you have posted b&c's web
site, he is one of three other atari dealers that are afraid to post
because of certain rule makers, and enforcers who have kept most other
atari dealers at bay from posting to this newsgroup specials and one of
a kind warehouse finds.
so you see in some way's you have helped.
ben has agreed to keep his ads to once a week.
is that so much to ask for what few atari dealers are left?
we know you do not like his position on auctions, niether do i, but do
you hound everyone for life who voices a opinion you do not like?

Thanks for the info, I'll give the ZIOCB method a try see if it works.
It'll probably be a couple of weeks before I get the time though.
I'll post any results here.

Incompatible with what? IMO it's very wide spread and used by many
commercial programs. Also, if you don't have a drive expansion it's 130K
against 90K (Single). Enough reasons for me to use it. :)

Freddy.

Source record: 26549

Partly semantics:
Reading the disk is a function of the drive capabilities whereas reading the data is a DOS function. IE, a stock 810 cannot physically read/write double or enhanced density diskettes created by any DOS.

This is totally different from the fact that a Doubled 1050 controlled by Dos 2.5 or MyDos reads the sectors and cannot make sense of the data in a single or enhanced or double density disk created by Sparta.

You can make external routines and utilities for any I/O task up to your abilities. I collaborated with a UK lad to write a Basic program that read 2.x SD/ED files and wrote them to a DD disk for transfer to a PC with HiasSoft AtariLnk. He had no access to a suitable DOS and it was faster than mailing a diskette across the pond. Expending the effort to duplicate a file management system is usually counter productive unless circumstances are extraordinary.

Your reading situation is actually easier than writing; you can use the resident disk handler to read sectors into a buffer and then let your BeWeDos write it back out in its own format. You have to manage directory entries, VTOCs, and forward pointers when writing.

Is Sparta compatible with BeWeDos? Any chance you could have Sparta be the medium between MyDos/2.x and BeWeDos?

Source record: 26553

Hmmm I couldn't get the right english word. Incompatible isn't the good word indeed. I was trying to say that is isn't a very STANDARD format. Ok it is standard to the 1050. But the 1050 itself is a /dutch "Eigenwijs" /dutch off thing. Atari always wanted to be backward compatible (that is a nice philosophy ofcourse) but that is in my point of view the problem with the 1050. First they told this was a drive with REAL double density. It is defniately NOT double density. The 1050 uses more sectors, but does not put more bytes in one sector. In sparta XINIT it is called "1050 double density" I likte that name.

I'm not sure, but I guess for the sectors between 719 and 1041 (=720 - 1040) it seems the enhanced (1050 format) uses an extra VTOC. And THAT is the stupidity of the format, and makes that it is very NON-standard.

Ofcourse it is an Atari Standard, and because of that it is used very much, and is it nice to use, if you program for diskdrive. But we live now in the year 200x and have more devices to use with our atari 8bit, and if I look at the enhanced format with these devices next to it... i stil say: that Enhanced format is a very stupid format :-)

(hehe you can see: I'm a spartados user :-))))))

If you have a VOM I would definately check the the 12V supply at the output pin of the 7812 regulator mounted on the heat sink before I went any farther.

I wouldn't worry about the 3086 yet. When you first power up a 1050 or insert a disk in it, it is supposed to spin up and determine the format, MFM or FM. This happens even if the drive isn't connected to anything. Since you are not getting a spin up either the 12V supply is dead or a chip.

Since they are modified drives make sure the jumpers to the ROM are set right on both drives. They are soldered in place to chose between a ~2732 and a 2532.

It has been a real long time since I looked at a 1050 schematic but IIRC the drive motor is controlled by the 6532/RIOT. In any case, 128 bytes of RAM are in the RIOT and it could be the problem.

5587. British Power?

I'm from the Netherlands, but afaik we use the same powersystem.

G = Ground = Green/Yellow
L = Phase (hot wire) = Brown
N = Null = Blue

Marius,

Ok, I see now that we mean two different things with ED. IMO the format doesn't depend on any DOS. There are more sectors, so why should SpartaDOS not use the extra sectors?

That DOS needs an extra VTOC to cover the extra sectors isn't stupid. Actually, I think it's a good thing to have the second VTOC at the end of the disk (if I remember correctly) because that's where those sectors are!

To be honest, that "1050 double density" always confused me. IMO "Enhanced" sounds correct.

Freddy.

Steve,

That "Real.Dos" sounds like a nice project. Your list of what you have in mind for Real.Dos looks ok, but some things are not clear to me....

1) What do you mean with 'OS Support'? Does it mean 'it will work with these OSs' or will it use some special features of the OSs mentioned and if so, which ones!

2) Will Real.Dos support all mentioned PBI/SIO devices in one binary? I mean, it would be a good idea to have separate 'driver' files for all those different devices because of memory usage, or?

I hope Real.Dos has a modular design so that it's expandable and make distributed development easy.
IMO it's important to define I/O vectors for driver files, so that others can add their own drivers quickly.
Please note I'm talking about 'drivers' not device handlers. Loading extra device handlers should _always_ be possible. Letting the low-level communication (SIO/PBI) through a driver makes the whole system very flexibel for usage with all kinds of 'strange' SIO/PBI devices (or even the more exotic things like MUX or I/O devices for the joystick port).

Looking forward to the first release....

Regards,
Freddy.

I don't know if this point is already made or thought about, but is this dos like spartados in the ram under the OS, or is the user able to configure that?

If you use the MyIDE cartridge version you can't use any DOS that is placed on that ram locations, because there is a soft-OS loaded.

Marius

Hey Freddy,

OK I see your point. And after I wrote my posting about those two VTOCs, I thought: in fact it is not that bad at all... and now you come with this reply.

I guess two VTOCS made the disk acces quicker if the vtoc has to be updated if you are writing and closing files...

Pfff this English is really hard.

Real.dos is a very large project. At this point I will not commite to
anything that is not already posted. Not to say it will not happen,
But. As you well know it is silly to keep adding thing in when I have
already set a deadline. Here are the hard true facts.

1) The progammer are not Selling this DOS.
2) We have already set out what we wish to do for Version 1.0.
3) We are not going to deveate from our plan. (I hate this editor
it sucks)
4) Future plans for Real.Dos are not set at this point.
I know that Tom has some Idea for it.
5) Source code will NEVER be relised. The CopyRight is ILS.
6) Real.Dos Will have a user guide and programming vectors
Published.
7) There will be ZERO MYDOS support in Real.Dos.

The big thing people need to understand, and I am not picking on you
persay, is the Atari 8-bit is a 64k machine, and you can not cram
everything into 64k!

I am very glad you have shown intress in the Real.Dos and what we
have planned is more powerfull than any Version of SpartaDos.

Have a great Day, Steve sjcarden@bellsouth.net

5597. Re: BEWEDOS and other formats

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-21 06:38:26 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <ap07c1rlm1@reader15.wxs.nl>
Source record: 26567

Is Sparta compatible.... etc.

That is the problem With MYide (the interface I'm writing new software for)
is with the cartrdige version non-compatible with spartados (because MyIDE
uses a SOFT-os in the RAM beneath OS... (that's were sparta is located).
Because I definately wanted I sparta-work-and-look-a-like DOS I use BEWEDOS
now.
I think bewedos is nice, but sometimes it is very strange too. I think its
rather unhandy bewedos 1.30 won't support bobterm, of almost no other RS232
using program (sight)

Bewedos 1.10 does support bobterm... BUT the bewedos 1.10 I have doesn't
handle the directory commands like CWD > and CWD < (in the docs this is not
mentionned as a bug, but IMO it IS)... So in BEWE 1.10 you can change the
dir down in the three: CWD TOOLS return and then CWD TXTPRO
But if you want to get UP CWD > that won't work.... anything else won't
work. If you want to load in txtpro (or any other program) something from
another dir, that won't work. Like loading D1:>startup.bat ... But ok...
this is a bewe 1.10 bug, so I switched to BEWE 1.30

So I have to acces a FILE on bewedos and mydos. If my computer booted in
mydos I have to acces the file in mydos, and if I booted in bewedos, I have
to acces it on bewedos. YOUR IDEA WAS GREAT!!! THANKS FOR THAT! Because the
file can't change in length (it is always the same, because you only can
edit parts of it, and not ADD or REMOVE) the write must be possible too in
an easy way.

I'll give it a try, and let you know how I'm doing.
Thanks again,
Marius

5598. Floating Point Package

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-21 09:12:22 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <ap0gck$2d0$1@reader15.wxs.nl>
Source record: 26568

Hello!

I feel pretty stupid. I have lots of documentation, and I still can NOT get the FP routines worked!

Can someone give me a example of an assembly source in which i can see how to myltiply two numbers using the FP routines.

I don't understand how to convert the integer to FP format in FR1.Isn't that possible?

I tried a simple routine to do this: "139 - 99" I don't want to use a keyboard input. Just to make a substraction, multiply, addition via FP (and please don't reply with : you can use ADC and SBC etc... that's just what I don't want, because i need this FP for large numbers in my future routine, I'm just testing now with easy numbers, before I get to the real work)

```
*=$4000
LDA #139
STA $d4
LDA #99
STA $E0
JSR $D9AA
JSR $DA60
JSR $D9D2
RTS
```

If I run this, and I look into my 6502 monitor I see this:

```
00d4: E3
00d5: 01
00d6: 5c
00d7 00
00d8: 5f

00e0: 41
00e1: 06
00e2: 51
00e3: 00
00e4: 00
```

```
Howdy folks

This is the lines I would like to speed up:

28625 FOR X=1 TO SECSIZE

28630 A$(X,X)=CHR$(PEEK(DBUFR2+X-1))

28635 NEXT X

I don't need any ASCII to ATASCII at this moment, as I'm just trying to read
the data. Maybe later. I'm still thinking about how I can best stuff all
the directory info in strings/string arrays (TurboBASIC has those). Stupid
thing is, CD's don't have a number that tells you how many entries are in a
directory, making it hard to guess how much space you need. And directory
and file entries can be up to 31 characters long. But most are not.

CU Mathy van Nisselroy

Try MYRD which is available from my site
http://www-users.rwth-aachen.de/mathy.van_nisselroy/mydos.htm. One version
will detect ramdisk size each time it's loaded the other will not. If MYRD
recognises that it already set up the Ramdisk, it will not format the
RAMdisk or other wise wipe out the files in it.

> a different microphone?, the cable to jstick port,
> the pot and a 2N2222 transistor.

Lemme see what I can make of that. Please tell me if I am wrong.

I'll start at pin 9 of the joystick, which is connected to the cap.
The cap connects to both E of the 2n2222 and one leg of the mini jack.
The other leg of the min jack connects to the 1meg Pot.
The pot connects to both the 100k resistor and one leg of the phone jack.
The other leg of the phono jack is connected to B of the 2n2222.
Pin 7 of the joystick is connected on one side to C of the 2n2222 and on the
other to the 100k resistor.

Hmm, now if we do the same for pin 5, we could have a stereo digitizer.
Anybody volunteering to rewrite the software?

CU Mathy van Nisselroy

PS THANKS!!!!

Steve,

Is this a political answer?

I'm not suggesting 'adding things in'. The questions I raised were more
about design and about the previous 'facts' you listed. If you can not
answer, please just say so. IMO you should save the lists of facts for later
if you don't want people to ask questions.

Maybe my words were not clear enough. I totally understand that we deal with
64K. That was my whole point with the suggestion of 'driver' files.

Ok, I'll wait and see....

Freddy.

Vintage Computer Festival 5.0
Saturday, October 26 - Sunday, October 27
Moffett Conference & Training Center
Moffett Federal Airfield
Mountain View, California
http://www.vintage.org/2002/main/

The Vintage Computer Festival is an international event that
celebrates the history of computing.

The mission of the Vintage Computer Festival is to promote the
preservation of "obsolete" computers by offering people a chance to
experience the technologies, people and stories that embody thexi
remarkable tale of the computer revolution.

Through our event and the Vintage Technology Cooperative Resource
Center--our publicly accessible archive of computer hardware, software
and literature--we promote interest in researching and documenting the
history of the computer. Above all, we promote the fun of playing
with old computers.

The Vintage Computer Festival is back with VCF 5.0 this weekend!
Enjoy talks on computer history and see dozens of old computers that
you've probably never seen before or never knew existed! Take the
Nerd Trivia Challenge. Show your stuff at the Retro-Code competition.
Take a tour of the Computer History Museum, or an excursion to the
DigiBarn.

Doors open at 9:30am. Talks begin at 10:00am and end at 2:00pm each
day. The Exhibit and Marketplace opens at 2:00pm and ends at 6:00pm
each day.

Admission is $10 per person per day for full access to Speakers, the
Exhibition and the Marketplace, or $4 per person per day for
Exhibition and Marketplace access only. Kids 17 and under are
admitted free of charge, and parking is free.

SPEAKERS

Year after year, the VCF produces an interesting and ecclectic line-
up of talks geared towards the computer history buff and the old
computer collector. The speaker schedule including abstracts and
speaker biographies can be found here:

http://www.vintage.org/2002/main/speakers.php

EXHIBIT

As always, the exhibit area will be full of dozens of old computers ranging from the late 1960s to the mid 1990s. See prototypes, first machines (i.e. serial #1), early GUIs, old iron, etc.

MARKETPLACE

The VCF Marketplace is the best place to buy, sell or trade those tired old computers yearning to be turned on again. It's the easiest way to unload that garage full of old computers. Sell them on consignment and let us do the work for you! Information on selling at the VCF Marketplace can be found here:

http://www.vintage.org/2002/main/vendor.php

TOURS & EXCURSIONS

We've got lots of tours lined up to the Computer History Museum, the DigiBarn, and the California Air & Space Center. Tour information including times can be found here:

http://www.vintage.org/2002/main/tours.php

CONTESTS

Think you know your computer history? Then take the Nerd Trivia Challenge!

http://www.vintage.org/2002/main/ntc.php

Think you can you write a full-blown video game in under 2 hours? Strut your stuff at the Retro-Code Programming Challenge!

http://www.vintage.org/2002/main/retrocode.php

DIRECTIONS

VCF 5.0 is being held at the Moffett Training & Conference Center (MTCC) at Moffett Federal Airfield in Mountain View, California.

Directions to Moffett Field and to the MTCC can be found here:

http://www.vintage.org/2002/main/directions.php

Be sure to bring along a valid picture ID (i.e. state driver's license or ID or a passport) to show to the security guards at the main gate.

LODGING

For out of town guests, hotel information can be found here:

http://www.vintage.org/2002/main/lodging.php

SPONSORS

VCF 5.0 is sponsored by the Computer History Museum and the Alameda
County Computer Resource Center.

Source record: 26585

Mathy, your description is correct.
If I read the schematic correctly, the cap goes
to center of mini jack, outside of mini goes to
pot, B and outside of phono.
Yes, there's a phono input, this is for sound input
say from a sound source other than a mike, like
recording from a audio amplifier, so you can make
digital music, or any audio source. The impedence
of the phono, I'm not sure. I guess that's what the
pot is for.
Regards,
Russg

My picture is a bit messed up. One side of pot
goes to B, outside of mini and outside of phono.
The other side of pot goes to inside of phono
and 100k resistor. I think your description had it
correct.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-21 20:32:16 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <kvZs9.6978$071.628875@newsread1.prod.itd.earthlink.net>
Source record: 26590

Hi Mirko;
More on the 'same page' theme:
Your MOVEUP$ routine specifies X and Y coordinates of the upper left corner
of the destination, which is fine, but not best for the MOVEDOWN$ version to
avoid extra math and we must begin moving down with the bottom line or risk
overwriting the source like the A$(2)=A$ trick.

Do you prefer any standard syntax for the USR(calls? Or will X, Y be source
in move down and destination in move up?

RE: Ebay advice needed from fellow Atarians please!
[DunxUK - 10/10/02 16:03]

I've have recently won some auctions from the Ebay.co.uk Seller BUBBOBOO. I also found that the mysterious bidder BODBIDDER had upped some of my bids and retracted any bids that made him the highest bidder.

Looking through his previous auctions I also discovered VARGJTGY, which I believe to be another of his accounts. Also, his current auctions have bids by a LANCING_RANGER (registered user - 11th October 2002), who started bidding after Ebay blocked any more bids from BODBIDDER and VARGJTGY.

Looking at LANCING_RANGER Feedback you will find Positive Feedback left by BODBIDDER at EXACTLY the SAME TIME and same Description as that left by LANCING_RANGER for BODBIDDER!

Also these two may be his accounts as well: SNESRPG and GRIDLOK_PTC

I've just contacted Ebay and urge any others who have recently won or bid on any of his auctions to contact Ebay and get this Ebay Seller Barred from Conning any more Atari Buyers!

5622. Re: Floating Point Package

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-21 22:25:44 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <I9%s9.7144$071.644688@newsread1.prod.itd.earthlink.net>
Source record: 26593

Hi Marius;
FR0 is the main FP register similar to the accumulator in 6502 math; most operations begin and results end in FR0. Let's multiply:

```
*=$4000
JSR $DA44 ;zero FR0
LDA #139
STA $D4 ;lsb of FR0, msb is already 0
JSR $D9AA ;Int in FR0 to FP in FR0
JSR $DDB6 ;copy FP in FR0 to FR1
JSR $DA44 ;zero FR0
LDA #99
STA $D4
JSR $D9AA ;Int in FR0 to FP in FR0
JSR $DABD ;mult FR0 times FR1, result in FR0
JSR $D9D2 ;FP in FR0 to Int in FR0 $D4-5
```

I don't remember how to detect and handle overflow when integer exceeds 2 bytes; there is a FP to ATASCII at $D8E6 which puts the numeric characters beginning at $580 with the final digit in inverse video.

I'd like to find this either as well, either in ROM or actual cartridge
form.

He's using a new tactic now. He used to use new accounts to shill bidders by overbidding them, retracting and then maxing their bids.

Since eBay are now getting wise to this he is now using new accounts to incrementally bid in tiny amounts (50p increments) until the next minimum bid drops below 50p, when he is within 50p of the winning bidder.

Just look at the bid history, the same new bidders place tens of bids on each and every item yet they always have zero feedback since they never ever win anything despite their frenzied bidding!

Don't pay him. I didn't.

Alternatively create a new ebay account and win every one of his auctions and keep it up until he packs in!

Only joking folks!!!!!!!!! :o)

Interesting story about this guy. Sometimes I believe on the internet are
more swindlers than legal users... we got a lot of orders in our online-shop
with wrong adresses. This lead us to that we accept new customers orders
only when payment in advance...
By the way: Here are a few of my auctions, also Atari - Stuff. I am no
swindler, but I really hope the end price will be higher than now...

5632. Anyone else order from Junie Creations?

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-22 15:01:41 UTC
From: Larry <larryr2@bellsouth.net>
Message-ID: <3DB56855.10406@bellsouth.net>
Source record: 26503

I ordered a souped up joystick from here, got a reply that my money order was received on 6/10/02, then I waited, and waited, and emailed, and waited, and emailed some more.

I saw on http://juniescreations.netfirms.com/ that they were having problems and weren't taking new orders. So I emailed, asking if he would refund my money, which he had for over 4 months now, and still no response.

Has anyone else experienced this with them? I've pretty much given up on getting my joystick or my money - I guess I'm just venting.

Yep!
afaik the MENU.COM of Sparta DOS merely reads DOS 2 single or double
density disks, but no medium/enhanced disks. So use the MENU.COM from
Bewe-DOS to do so... -Andreas.

Message-ID: <3DB5A029.44647869@students.uni-mainz.de>
Source record: 26508

Well,
if you don`t like the medium/enhanced format, the answer is simple:
don`t use it !! Anyway, Atari brought us the 1050 with enhanced density,
allthough we all would have liked it to be true double density
(180kbytes / 256 bytes per sector). But, this is a fact no-one can
change. the 1050s are there and they merely have medium/enhanced
density. The users (may) should have ignored that density and used
single density or (with an upgrade) double density instead. Fact is,
they did not! Especially here in Europe, many upgrades were made to
support a) true double density and b) ultra/warp/high/turbo/... speed.
Guess what, the programmers used the speeders (or supported them) but
they did not use double density. Quite a lot of programs were made in
medium/enhanced density - and a lot of these programs were bootdisks
(goodbye to harddisk usage - unless you are a cracker). Even most
filedisks (program files) were written in such a nice way, that they
will work alright with any density that uses 128bytes per sector, but
they will crash with other densities, that use 256 bytes per sector.
Well, thats why I gave my Atari harddisk away - I am not a
hacker/cracker, but I had and still have hundreds of programs, that are
single/enhanced bootdisks or files that do not work with double
density...

By the way, only DOS 2.5 and some compatibles (Turbo-DOS, Bibo-DOS,
Super-DOS) use a second VTOC in medium/enhanced format. Most other
DOSses use other tricks (and thus more incompatibilities) to access more
than 719 sectors. MyDOS, Top-DOS, DOS II+D and many other DOS 2.x
derivatives do not have a second VTOC (so their medium/enhanced format
is incompatible to DOS 2.5!). -Andreas.

Well,
by the way: you don`t need two SIO cables to create a
Gamelink-2/Multilink. One SIO cable is enough, if the two computers are
very close to each other (less than 1 meter). All you have to do is 1)
unscrew the SIO cable on one side and open it 2) change/exchange cable 3
and 5 (cable 3 becomes cable 5; cable 5 becomes cable 3) - if you are
confused take a look at the nice Gr.8 picture that Jiri Bernasek had
drawn and in less than 2 minutes you are done. Of course you can always
turn this "patched" SIO cable back into a normal SIO cable again. The
patched SIO cable works fine as a Gamelink-2/Multilink device for 2
computers and thus 2-4 players. I have tested it with Agdagon,
Multi-Dash, Multi-Race and Multi-Worms. The big advantage: since
everyone (who owns a real Atari!) has at least one SIO cable, this will
cost you nothing! And there are already 4 gamelink/multilink games
waiting for you... -Andreas.

```
Hello Mathy,

you won't need 6502 code, try the following:

DIM A$(MAXSECSIZE+1)
REM The following will set the length of A$ to SECSIZE
A$(SECSIZE+1,SECSIZE+1)="X":A$(SECSIZE+1,SECSIZE+1)=""
MOVE DBUFR2,ADR(A$),SECSIZE

The setting of the length of strings works in ATARI BASIC, I used it
many times to read a file in a string, so it should work in
TURBO-BASIC too, maybe TURBO-BASIC zeros the string.
Of course you won't need the MOVE-command in TURBO-BASIC if you read
the sector directly into the string (will be faster):
Simply set the address of the I/O-buffer to ADR(A$), e.g. use DPOKE
IOCB+4,ADR(A$) instead of DPOKE IOCB+4,DBUFR2
```

Message-ID: <Bfpt9.9701$071.867841@newsread1.prod.itd.earthlink.net>
Source record: 26517

It is the carry flag; it will be set on errors like divide by zero or exceed
10^98 in a multiply; also set for a negative number or exceeding 65355 in
conversion attempt of FP to a 2 byte integer.

You test with a BCS HANDLE_ERROR after the JSR FPI so you can print a
message or take appropriate action after an overflow.

I think the credit card is necessary only if you want to sell on ebay.
That way they have a way to bill you.

I think buying is open to anyone. All that is necessary is an email
address and we all know how easy it is to get those.

-Bob

5650. This Guy On Ebay Has Really Rare & Unusual Old Video Games Being Sold NOW!!

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-23 06:55:01 UTC
From: Josh Blevins <procyon@earthling.net>
Message-ID: <8s4crukiecvp2eq888rqhuvfkek4kulu0v@4ax.com>
Source record: 26521

It's a damn shame I don't have any money right now, I was just on Ebay
and saw this guy selling off a lot of rare old video game items I
didn't even think existed anymore, for systems like the Atari 2600,
5200, 7800, Intellivision, Colecovision, and many others. Some of the
items I saw just for the Atari 2600 alone, for example, included an
OFF YOUR ROCKER cartridge, a KIDVID with SMURFS SAVE THE DAY, CUSTER'S
REVENGE (Mint in box!!) STARP)ATH ITEMS, and even a GAMELINE MASTER
MODULE and an Atari 8-bit SPRINGER Mint In Box!!
Here's the link:

http://cgi6.ebay.com/ws/eBayISAPI.dll?ViewSellersOtherItems&userid=possum-glory%40usa.com&
include=0&since=-1&sort=3&rows=25

He seems to be adding bunches of more items once a day or so, it's
probably a good idea to keep checking back to see what else he's got,
based on what I've seen him put up for sale so far!! Best to hurry
though, some of his auctions will start ending in a day or two.
Hoped this helps someone find something they've always been looking
for!

---Josh

5651. BUBBOBOO is no more

Well done eBay.

5652. FS Atari Stuff - S. Florida

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-23 11:50:59 UTC
From: naboo@orca.net
Message-ID: <3db68c26.3986241@nntp.ix.netcom.com>
Source record: 26523

I still have a bunch of Atari computer stuff including an 800 and a 1200xl, disk drives, Atari printers, everything with original Atari power supplies (which seem to be premium items on Ebay). Ebay is not very feasible due to the potentially high shipping cost (this stuff has significant weight), so I'm looking for a South Florida Atari club buyer. Anyone have any thoughts on the true value of these items?

Please post responses here. I'll email in return. thanks.

In addition I have just found his advert spammed across other groups, a practice I believe is a no-no with ebay. Being that it's a spam and one of the groups has an anti-spam policy I can almost guarantee that his sale will be reported by 99% of the folk in that group and pulled.

Methinks he should have done a 'noodle dance' before this stunt :-)

H&#65533; Ron, Mirko,

Looks like a nice compact routine to me! :)

As a minor change, you could use the X register for LINES (see ** below).

If the routine is called often, the MULT routine could be made faster.
Ofcourse the whole routine can be made faster, but that would require much
more memory and make it non-relocatable.

Freddy.

Thanks Dean!
Nice to be able to buy some Atari software. Just got mine delivered in a very timely manner, here in NJ, USA. So far it looks very good. I've only had time to scan the 1st CD, and have started to read the Quick programming language manual. The two CD set is a great value for the money. I'm one very happy customer!

Yes, a multiply by 40 using a sum of 5 left shift/rotate (32x) and 3 left shift/rotate (8x) is bigger code yet fewer machine cycles due to iterations through the loop.

Absolutely right... I should have suggested incrementing the value of DBUFR2
by SECSIZE and adjusting the IOCB before each sector read directly into the
string with CIO.

WELL, I checked the voltages across the 3 pins of the 7812 mounted on the
heat sink. It was something less than 12 volts(11.7), zero(0) volts, and
something close to 24 volts. Suddenly the drive came alive, and the
read/write head moved to the center of the drive and kept on bumping into
the center. I shut the power off, moved the read/write head out to the
outside of the disk(after removing the disk) and when I turned it back on,
the read/write head drove to the center of the drive and kept bumping up
into the center of the drive. Making real progress here! :)
Where do we go from here?

Could be the a bad solder joint in there somewhere. They come loose from
thermal cycling. There are just 2 diodes and the 7812 <5 spots> you would
have to solder if it returns.

> Where do we go from here?

Just a jumper problem or track zero sensor. I would only check those two for
now since everything else seems to be popping.

One of the connectors does go bassackwards, looks like it is plugged in
wrong when you have it right.

I thought track zero is on the outside vs. inside. I don't know what happens
if you plug the stepper in backwards, maybe goes to the inside?

5665. Ram Upgrade for 1200XL

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-24 02:30:14 UTC
From: Richard Heldmann <rheldmann@rcn.com>
Message-ID: <ap7lvkdbr1@bob.news.rcn.net>

Rambo works on the 1200XL. They had jumpers for selecting the 800Xl or
1200XL. I also have a Newell 1 meg upgrade installed in one of my 1200XLs.
I'll have to see if I can find the docs for it.

Someone did a Visual Pinball port of the 2600 Midnight Magic, gave it a
3d tilt, then I redid some minor bits to make it look/act more like the
2600 version. Not an answer to your question, but I thought you'd like to
know. You can download Visual Pinball from http://www.randydavis.com (for
x86 Windows boxes w/ the Visual Basic scripting active)
also, IMO, it should be reasonably trivial to port the original code to
the atari 8bit computers, if you really want one badly enough.

5671. CD ROM error check routine (Request Sense)

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-24 10:38:03 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <ap8iidlaa1@nets3.rz.RWTH-Aachen.DE>
Source record: 26542
Cross-posted to: comp.sys.atari.8bit,comp.sys.apple2,comp.sys.msx,comp.sys.cbm

Howdy folks in c.s.atari.8bit, c.s.apple2, c.s.CBM and c.s.msx

I'm trying to make my Atari 8 bit computer read data CD and have stumbled
upon a problem.

What should I do when Request Sense returns an ASC code of 6.
Should I TEST UNIT READY or try to read the Primary Volume Descriptor (PVD).

When I wrote my CD Audio player utility, I'ld read the TOC, but reading the
PVD will return all zero's. (when the CD isn't loaded yet)

I can read 6502 source code, so a piece of source code would do.

CU Mathy van Nisselroy

PS anybody know a good source for what exactly we should do if this or that
ASC or ASC Q code comes back?
I do have the T10 info, but that's not always very clear to me.

Howdy Ron

Thanks, I'll see what I can do. I do have MAC65 both on cart and disk, but I don't know much about how to use it. ASM,,#D:name.ext should do it I guess???

BTW I've read about the trick with fooling BASIC when it comes to strings. I think I'll leave that for when I know what they are talking about.

CU Mathy van Nisselroy

PS the problem with copying directly to a string is that everything has to be converted to (AT)ASCII somehow. Otherwise I could have use MOVE.

The SPACE BBS is kept by SPACE member Nolan Friedland, friednw@tcfreenet.org.
I'm just the club president, which means I'm in charge of...presiding. :)

Nolan also keeps two lists of active Atari 8-bit BBSes:
telnet: http://tcfreenet.org/~friednw/bbs-telnet.html
dialup: http://tcfreenet.org/~friednw/bbs-dialup.html

I don't see anything that looks like M.A.C.E. or J.A.C.S. in those lists.

(who owns rights to Parrot.)
You have the right people. Tony Ramos would know.
We (here on csa8) communicated with the guy from
Alpha Systems, but I can't remember his name.
I don't know the rights to it. I doubt it was patented,
the software for it would be copyrighted and probably
what controls any way to use the interface.
The guy from Alpha Systems seemed to be willing
to put A8 stuff in the public domain.
You might try aramos@ele-mental.org.

5680. SpartaDos on PC XFormer

Source record: 26454

I only can say: don't use XFORMER, but the real thing. Ok you don't have that perhaps... if you still want to use an emulator. Use the Atari800Win Plus 3.0 (it is much better than Xformer)

Or the Atari 800 for dos.

http://atari800.atari.org

The link to the atari 800win+ is lost here, because of a PC crash. So search on the net.

Spartados (and most other things) work fine on these emulators.

```
Hi Mathy,

???
Ron's routine is an implementation of MOVE, so where is the problem ?

On the ATARI there is no difference between bytes and
(AT)ASCII-characters.
Characters are only another view on bytes, e.g. 32 is space, and 65 is
"A".
So you won't need any translation, the Screen-Handler "S:" (resp. the
Editor-Handler "E:") will "translate" the bytes in memory to readable
characters on the screen, if you PRINT a string of bytes.

As a proof try the following:
DIM A$(20)
A$(20)="X":REM set length of A$ to 20
POKE ADR(A$),65:REM ASCII code for the letter "A"
?A$(1,1):REM This will print an "A" on the screen

Here is a little program to read a diskfile in a string:

MAXSIZE=32000:REM Max size of the file = 32000 Byte
DIM A$(MAXSIZE+1)
A$(MAXSIZE+1)="X":A$(MAXSIZE+1)="":REM Sets the length of the string
to MAXSIZE
OPEN #1,4,0,"D:FILE"
BGET #1,ADR(A$),MAXSIZE:REM read file into A$
FILESIZE=DPEEK($358):REM get the size of the file
CLOSE#1

Now you can PRINT the content of the file:
PRINT A$(1,FILESIZE)
```

Source record: 26460

Yes, that ASM command will create the object file which begins with $FF $FF
STADRLO STADRHI NDADRLO NDADRHI as the 1st 6 bytes. These 6 must be removed
and the remainder converted to data or characters for execution by Basic.
For small routines like this, I just use the screen editor at the Ready
prompt:
OPEN #1,4,0,"D2:BYTMOV.OBJ":FOR L=1 TO 999:GET #1,B:? CHR$(B);:NEXT L
<Return>
It will end with an error 136 (EOF) and leave a gibberish line on screen.
Just cursor up, insert some spaces for line # etc, delete 1st 6 characters,
and enter $tring definition like:
950 ML$="hh&*h%)h#(..."
It should usually end with a diamond unless the RTS is back in the middle of
the routine. Press Return over the line and then List that line to a file
for Entering into your program or leave the line on screen and Load your
program and press Return over the line to insert it.

The Track Zero sensor *IS* on the outside, but one symptom of problems with
it is tendancy of the head to advance toward the center. Normally the head
makes just one step toward the center each time the power is initialized.

We do not yet know the contents of the disk buffer; any needed ascii to
atascii translation code would go between LDA (SRCE),Y and STA (DEST),Y
which MOVE will not do. The most likely incompatibilities would be char 125
& 126 and some awkward formatting with 10, 13 & 127 plus the gibberish of
all less than 32. Maybe Mathy asked the wrong question and one of your tips
will suffice.

Source record: 26465

You may want to check out Stefan's tips...

Check Mapping for Variable Value Table (location 134-5); it describes the 8-byte contents of each variable's entry. The important bytes are the DIM length, current length and offset from the String Array Pointer (location 140-1).

Basically you DIMmension a dummy string as your 1st variable so it will have the 1st entry in VVT and be easy to locate. Later, under program control so it cannot shift, you alter the length and offset bytes corresponding to your buffer. Only the offset in bytes number 3-4 requires much thought, and it is easily calculated:

```
OFFSET = DBUFR2-(PEEK(140)+256*PEEK(141))
OFSTH=INT(OFFSET/256)
OFSTL=OFFSET-256*OFSTH
POKE PEEK(134)+256*PEEK(135)+2,OFSTL
POKE PEEK(134)+256*PEEK(135)+3,OFSTH
```

The current length goes in VVT+4 & +5 and a suitable DIM length goes in VVT+6 & +7. After this is configured, a quick A$=DUMMY$ copies CURLN bytes from DBUFR2 into A$ and sets the proper length for A$ at CURLN.

Hi, I'm Ben Smith of Bravo Sierra Computers! Your Benefactor, an Atari Dealer. Offering Sales, Support & Service of Atari HardWare, SoftWare, Books & Accessories for the Classic Atari 8 Bit and Atari ST Computers plus the 64 Bit Atari Jaguar Game System. I am a Reseller of Used & New Atari Collections! Much of which were the Treasures of Former Atarians, Locked away in Dungeons, now given New Lives, offered to be sold as New found Treasure, back in Circulation in the Atari MarketPlace. Hidden and Forgotten, Now set free from the secret hiding places. Atari Heaven where former Atarians had left them to Die. Saving Wondrous Collections from being irretrievably Lost! As well as Saving entire inventories from defunct Atari Dealers, much of it +NEW in the BOX/BAG! After Languishing in Forgotten Warehouses, long abandoned by retired Atari Dealers!

I love saving my customers money! I mainly use Postal Delivery! I save money for my customers when using Postal 2-3 Day Priority Mail & Global Priority Mail. I use Packaging supplied by the Post Office for free and Pass on the savings. I sell Atari, I'm not in the Business of Profiting from Marking up on the cost of Shipping! And just like the Postal Service I avoid making promises I cant keep. The Post Office sends Packages by 2-3 Day Priority Mail. They don't promise 2-3 Days but they have a Good record of Following through! Once I receive payment, your order usually goes out the same Day! This is not a Promise, but like the Post Office I have a Good record of following through! Ask my Customers! I also have Libraries of Reference Books for the Classic Atari 8 Bit and the Atari ST Computers! I have ways of saving Money on Postage by Sending it Book Rate. I also have some tricks for saving on Postage when Mailing outside the United States! I Ship Atari anywhere the Law allows! If you don't come to me, I cant save you any Money!So check my HotLinks below, E-Mail me at atari@aracnet.com or call Ben anytime at (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

> and the remainder converted to data or characters for execution by Basic.

Aha, I had a look at the code yesterday evening and thought what should I do with these addresses that are inthere. If I read the above right, I just kill them after the code has been assembled.

> For small routines like this, I just use the screen editor at the Ready
> prompt:
> OPEN #1,4,0,"D2:BYTMOV.OBJ":FOR L=1 TO 999:GET #1,B:? CHR$(B);:NEXT L

characters,
> and enter $tring definition like:
> 950 ML$="hh&*h%)h#(..."

Let me check if I understood this. I do the 950 ML$ part and the contents of the sting ("hh&*h%)h#(...") is what came out of the 'Bytemov file to screen' routine?

CU Mathy van Nisselroy

PS maybe I've already tried (and succeeded) by the time I read your reply.

> characters on the screen, if you PRINT a string of bytes.

That would mean ?A$ and ?CHR$(A$) would display the same thing. I was under the impressing the first one would display the ATASCII code, the second the character. ("?A$" will print the whole string, "?CHR$(A$)" won't wiork like that, it needs a FOR NEXT loop and be used as "?CHR$(A$(x,x))". I just used the short form to keep it short.

> Here is a little program to read a diskfile in a string:

I'm reading sectors of a CD, not files from a disk, sorry.....

I went to the website for this computer fair. It seems to be all about old mainframes from the past and has nothing to do with Apple 2s.

That's fine of course but is certainly of less interest to me than if it was about older personal computers and included apple 2s.

Bruce

We *always* have to start with 'Your Atari Computer' by Lon Poole with McNiff and Cooke.

Then, maybe 'De Re Atari' and the OS and Technical Reference Manuals followed by about a Dozen 'Compute!' titles which were largely compiled from articles in their magazine. Sams Computerfacts also issued a 400/800 reference volume that is excellent. 'Atari Roots' and several Basic tutorials were also useful.

Any drive which supports other than 128 byte sectors *should* conform to the
Percom configuration block. Check the MyDos 4.5 docs for info on reading it
and which of the 12 bytes contains the sector size info. I thought the
config command was greater than $47 in the range of $4E or so...

Hi!

> Does anybody have any information on how you would go about detecting
> sector size for a disk drive?

In 6502 code you can do this:

```
LDA #DRIVENO ; number of disk drive to check (1 to 9)
STA $301
LDA #'S ; S means STATUS check
STA $302
JSR $E453 ; Disk-Interface-OS-Routine (this will call SIO)
BMI ERROR ; Error occured (e.g. Disk drive switched off)
LDA $2EA
AND #$20 ; check Bit 5 of $2EA for Double Density
BNE DOUBLE ; double = 256 bytes/sector
BEQ NOTDOUBLE ; not double = 128 bytes/sector
```

Unfortunately, this doesn't work on the XF551. You will need some more
complicated code to do correct density check on the XF551. Please post
a message, if you're interested. (SpartaDos can't handle the XF551.)

Stefan

CHR$(is a function which operates on a single numeric while A$ is variable
which must contain character(s). You cannot have CHR$(A$); the format would
have to be CHR$(VAL(A$)) even tho it is just a matter of convention that
Basic interprets one as numbers and the other as characters.

?A$(X,X) and ?CHR$VAL((A$(X,X))) would yield the same results.

Yep, relocatable routines need no addresses since they will execute in any
location.

Very correct, you do the 950 ML$=" part. You will start to recognize many of
the characters after doing a few. The only problems arise when you have a

155 (EOL) or 34 (quote) to get into the string. It takes a separate command
to insert like ML$="hh&*h%)h#(...":ML$(10,10)=CHR$(34)

5715. Saving rare atari programs/disks

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-26 03:01:29 UTC
From: williamson527@aol.com
Message-ID: <20021025230129.24042.00000601@mb-mm.aol.com>
Source record: 26486

I've been out of the atari area for awhile and I tossed my old hardware long ago. But I just couldn't toss my old programs. I've searched online for disk images of them and I found most of them, but there are a few programs that I still have that I can't find anywhere. I'd like to be able to save these programs. I must warn that most of my disks are pirated copies from my pre-teen days back in the early to mid-80's. THe last time I used nay of these disks was back in 1996, but I believe they still work. ANy advise on how to save these rare games and programs? I am willing to give these disks away if I was able to obtain a copy or a disk image of the rare ones. MY email address is: a38101041@HOTMAIL.COM

For example, I have a favorite game called air rescue. I found a air rescue on holmes atari site, but it isn't the same as mine. Perhaps mine is airrescue II? The theme music is Beethovens fi¿½r elise. The chopper is yellow and the enemies look like something from space invaders, with ground and wall cannons that keep firing until the centers are destroyed. The scenery looks like some sort of maze lab or a underground lab or something. I loved this game as a kid and I want to save it if possible. Any takers for my offer?

I think a good idea would be to contact A. Holmes and offer the disks to him. That way you can get a copy for yourself and he can share it with the Atari community.

Cross-posted to: comp.sys.apple2,comp.sys.apple2.marketplace,comp.sys.atari.8bit,comp.sys.cbm

The festival is about vintage computers (big and small.). If you like vintage computers, then you'll like the event. If you don't, you won't.

Source record: 26491

I'd be willing to take the chance if Holmes can't be reached. It would
actually be much easier to do if they are pirated since any copy-protection
would be removed. If they are copy protected I can make PRO images which
most uptodate emu's support now. I think it would be legal on my end since
I'd just be providing a software transfer service in exchange for floppies
to use as blanks. Much like the way photo developers can't be held
responsible for the content of the photos. And I wouldn't be posting any of
the images to any websites without the express permission of the appropriate
people.
Rambling like Russ....

5721. The last Rambit Turboload kit - your chance to bid

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-26 09:40:06 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1035625940.89915.0@doris.uk.clara.net>
Source record: 26492

Hello All,

It has come to light recently, that I have available for sale the very last Rambit Turboload kit that is ever to be available again. Rambit no longer make these, and no other new kits are available. This is your chance to own the last of these unique hardware modifications for the 1010 and XC12 data recorders. Once fitted, it allows tapes to load 6 times faster once converted with the conversion software supplied. Installation is easy, but does require the use of a soldering iron.

In order to give everyone the chance of owning this, I am accepting bids by e-mail. Bids should be over US$30. Full information (with photos) can be found on the website at http://www.dgs.clara.net . There is a link to the page on the main page (under the ads). Please read the info on there before making a bid.

Dean Garraghty

5722. Manual scans

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-26 10:11:33 UTC
From: Aaron Wheeler <holmesatari@hotmail.com>
Message-ID: <MNtu9.12245$b5.1470508@news02.tsnz.net>
Source record: 26493

Hey guys/gals,

I've been slowly scanning my collection of atari manuals over the last few years, and although I still have heaps to go, I have done quite a few. Is there any others scanning in their original/photocopied manuals? If so, I'd be interested in hearing from you, maybe we can swap cdroms? I'm doing both games and application manuals. And to save myself some of the effort would be great.

I do have the intentions of 'maybe' getting them all online one day, but space is an issue. Yes I could OCR them, but I prefer seeing the original layout as much as possible.

Cheers

Aaron (aka.Holmes)

Doesn't the 1050 Enhanced density also report to that status command with
bit 5 in $2EA?

BTW, I do not have an XF551, but certainly believed that Sparta could use it
in several density configurations.

Hi!

I have 2 iomega zipdrives (IDE) and they won't work with the MyIDE nor the SIO2IDE interface.

Both fail and I'm almost sure they are not broken.

Who knows what's incompatible with these devices?

Btw. I have SCSI zipdrives too, and they work fine with the BlackBox.

Marius

Alright, it was this year very interesting, alot of new ideas, new people
and ofcourse alot of good friends.

Greetinx to all people who where on JHV 2002.

The next meeting/party you can join is http://eil.atari.org in April 2003 be
there, also 8-bit! I already heared that most active 8-bit people from The
Netherlands and Germany will come. Hopefully like last time also the
Swedisch, Polisch, English people and maybe some people from other places in
the world.

TXG/MNX

??? Sparta-Dos is about the only DOS I use, and never had problems using it on both standard XF551 as the ones that are modified
to drive a 80 track/720KB mechanic...

Speaking about DOS'... What's the current status of XDOS ? Is it still a commercial product, or is it allowed to place a copy on
the net to download?

5746. 130XE Display

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-27 19:21:11 UTC
From: Phee <ptros@yahoo.com>
Message-ID: <WVWu9.12561$46.7494@fe01>

I'm in the process of getting my hands on a 130XE. What types of display will the XE accomodate? I used to have one with a monochrome monitor, think it was composite or something (can't recall as that was 15 years ago). What can I use as a display for this 130XE? Do they still build monitors that will work with this computer? I'm currently thinking I'll use a video capture card on my Windows PC and hook it up that way.

Any advice? Better ideas?

Thanks
Ptros

I own a 130XE and I use a composite video out. I had to make a breakout cable to go from a 5-pin (or is it 7-pin) DIN connector to a RCA audio and video plugs. I forget the pinout now but it may be possible to get s-video (y & c) signals from this connector as well.

You can hook up the 130XE several ways:

1. Via the RF modulator to a TV/game switchbox on your TV.

2. Via the monitor jack to a composite video capable monitor (your VCR or
capture card will take this.)

3. Via the monitor jack to a monitor that will accept seperate luma and
chroma video (most of the commodore monitors).

4. Fabricate or buy a S-video cable that hooks up to the luma-chroma
connections in the monitor jack. Most new TVs and other devices accept
S-video.

Using the luma/chroma interface would be the best. You can even look into
the SuperVideo modifications to get some extra quality from the video on
your 130XE, if you aren't shy about doing some desoldering/soldering. I
personally haven't done it on the 130XE, but on several other models.
Makes a noticable difference.

I found the pin outs for the 130XE and trying to find the pin layout for S-Video. I'm sure I'll find something on the internet to detail this. Once I get that down I'll solder the parts together and see how it works.

I currently have an Atari 400 that I connect to a TV using, I believe, a 75hz converter. This method of display on my Windows based PC is marginal at best. Any improvement over what I currently have with my 400 is my goal.

Looking at the specs for S-Video it should provide a substantial improvement over the display I experience with the Atari 400. I assume we both agree on that.

Is shielding or impedance in the cable I'm making to be considered? I've found that other long video cables I've used/made in the past have created some undesirable results.

Thanks
Phee

I haven't had any problems with mine, but I just spliced two RCA cables
with an S-video cable, so there may be some shielding in there already.
Normally I used my commodore monitors and seperate luma/chroma with my
Atari 8bits.

Hi 6809 is way better
a 6502 can never do much (have used many apple]['s and CoCo 3) I liked
OS 9, great system .
I ran 2 terminals on my coco 3 under os 9. OS 9 is much like unix . I
liked OS 9 and Xenix both are great systems. The 6502 too limited due to
limit of the stack pointer set at 100h.

just my biased ideas.

I ran across a box full of old 8-bit Atari stuff in my closet the other day. There is an 850 interface, a ton of such software as Atari Macro Assembler, Microsoft Basic, Imperium Galactium, etc. with manuals and a bit of hardware such as a printer cable and joystick extension cords. I can't promise any of the diskettes are still readable but, I'd rather see it get a good home than toss it. So, if you live in the Norman, OK area and can come by and pick it or are willing to pay the shipping and maybe $10 for aggravation, it's yours. (If you want it shipped, I bet it'll cost a small fortune. It is in a 12"x12"x24" box and weighs about 20 lbs.)

Well, that would be pretty interesting, a bitter programmer/publishing house
looking to snag a pirate in their net for a 1985 game on an obsolete system.
The sad part is that if the corporation was big enough they would have their
way with US laws and lock him up for years ;)

Aaron, have you contacted the webmasters at www.atariage.com ?

They have an extensive collection of manuals for all the Atari consoles and they are working on getting the 8-bit section up next. I don't know how far they have gotten but I would think there goals are the same as yours. And they could probably work out something with server space as well.

The Zip drives are almost certainly ATAPI devices, which require a 16 bit interface implementation. The same is true for CDROMs and some functions on an IDE hard drive. Devices that will work on an 8-bit IDE interface include all hard drives, CompactFlash cards and SyQuest removable-media hard drives.

Use a good television with a s-video input. You can even find LCD monitors with s-video. You will have to make your own cable from a s-video jumper (I use 10 foot cables and cut them in half to make two cables) and a 5 pin DIN connector. You also need an audio tap at the DIN connector. Usually, the LUMA line needs a 100 ohm resistor to ground - the Atari puts out a little too much signal for some inputs.

Hi,
It seems like nearly everyone already got his SIO2PC cable by now.
Please note however that at the same price you may now have a 1050-2-PC cable
for a change. That way you wouldnt have to put your Atari by your PC. Your
1050 driven by your PC would do the copying job.
Check it out at:

Hello to all Atarians,

I just listed a Happy Computers Atari ST Discovery Cartridges for sale on eBay, it's worked great for me... Auction includes the cart, cable, and utilities disk.... Also included (but not mentioned on ebay) is a custom disk I put together which loads the cart prg. into a ramdisk and allows you to edit/customize the archiving parameters... Many customized routines are included for specific ST prgs. that were not on the orig. disk.. You can ALSO archive atari 8-bit prgs. (if you have a 5.25 drive attached to your ST), AND PC and MAC floppies!!

see listing at:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2065413719&rd=1

Mathy, that's not a very good picture, I mean I can
see you showing Fox-1 your watch, but both of
you aren't facing the camera. Sorry, I mean I wanna
see facial hairs.
I have a picture of me at my website, not good but
you can see my face.
I'm not going to scan a picture I made of my setup.
I'm looking at it.
A 800XL with Omnimon. A 1 meg MIO, a Commodore
monitor, my grandson playing a Deluxe Invaders cart,
a US Dblr 1050, a Adaptec 4000A, two Seagate 20 meg
hard drives, a PC power supply for the Adaptec and
HDs. A table fan blowing on the HDs. A orange and
green squirt gun for squirting my dogs when they bark.
Some floppy disks, a bottle of 90% Isopropyl Alcohol,
some books on a shelf, a bottle of Windex for cleaning
my glasses, pen, small screwdriver.
Lots of junk on my junky workbench.
I figure a few words are worth a 1000 pictures.

Well,
if you use the standard (unpatched) sparta DOS with an XF551 it will
print an error upon boot-up on the screen: "Error - no DOS!". This means
you have to press Reset and boot again with your XF drive. Then
everything works alright. there are several patches for SpartaDOS and
the XF551 drive available, unfortunately there are several sparta
programs which do not like these patches... greetings, Andreas.

> ??? Sparta-Dos is about the only DOS I use, and never had problems using it
> on both standard XF551 as the ones that are modified
> to drive a 80 track/720KB mechanic...

I've tested Sparta-DOS 3.2f from FTE (rev. date 25.02.94) and this
version has big problems with the XF551. If you boot it from a single
density disk in an unmodified XF551 and insert a double density disk
in this XF551 drive, Sparta can't read the directory ?!?

So it seems, Sparta can't detect double density, after it accessed a
single density disk. Other DOS versions like Turbo-DOS, Bibo-DOS or
XDOS don't have these problems. Maybe there's an utility to correct
this problem, but I haven't seen it yet.

And Sparta writes to $D5xx when booting. This is dangerous, since
there may be some cartridges, that have I/O at $D5xx installed (e.g.
the MyIDE interface).

> Speaking about DOS'... What's the current status of XDOS ? Is it still a
> commercial product, or is it allowed to place a copy on
> the net to download?

XDOS is not PD. I've detected some minor problems (of course no FMS
errors), so I plan to make a new revision and publish it in the ABBUC
magazine. But first I'll complete the software for the Flashbox
cartridge, since a flashrom-disk will simplify software development
:-)

> Doesn't the 1050 Enhanced density also report to that status command with
> bit 5 in $2EA?

The 1050 sets Bit 7 in $2EA, if the disk is enhanced density. So you
get the following table for density checking:

Bit 7 Bit 5 Density
0 0 Single
1 0 Enhnaced (Medium)
0 1 Double

This works with most drives. Some drives need sector 1 to be read
before the status command delivers the correct density of the inserted
disk. But this doesn't work with the XF551. The best way to do a
density check on the XF551 is to read sector 4 via SIO with $303 set
to zero (this is to avoid checksum errors, if the sector length in
$308/9 isn't correct (128 or 256 ?)).

Stefan

5781. The last Rambit Turbload kit - your chance to bid

Newsgroup: comp.sys.atari.8bit

From: Dean Garraghty <dgs@clara.net>
Message-ID: <1035845390.48910.0@demeter.uk.clara.net>
Source record: 26251

Hello All,

It has come to light recently, that I have available for sale the very last Rambit Turboload kit that is ever to be available again. Rambit no longer make these, and no other new kits are available. This is your chance to own the last of these unique hardware modifications for the 1010 and XC12 data recorders. Once fitted, it allows tapes to load 6 times faster once converted with the conversion software supplied. Installation is easy, but does require the use of a soldering iron.

In order to give everyone the chance of owning this, I am accepting bids by e-mail. Bids should be over US$30. Full information (with photos) can be found on the website at http://www.dgs.clara.net . There is a link to the page on the main page (under the ads). Please read the info on there before making a bid.

Dean Garraghty

Hi,

if youï¿½re looking for NEW , shrinkwrapped ATARI XE games , please look
at

http://cgi6.ebay.de/aw-cgi/eBayISAPI.dll?ViewSellersOtherItems&userid=klassische-videospie
le&sort=3&page=1&rows=25&since=-1&showpics=1&stab=0

We have hundreds of new,boxed ATARI 2600 or ATARI 800 XL/XE games good
prices.Donï¿½t pay much money for used crap if you can still have
factory-sealed NEW ATARI 2600 or 800 XL/XE games.

We have :

Rescue on Fractalus , Airball , Davidï¿½s Midnight Magic,Desert
Falcon,Crime Buster,Archon,Ballblazer,Millipede (big or small box) ,
Tennis (big box) , Star Raiders 2 , GATO ,
Hardball,Thunderfox,Crossbow,One on One,Lode Runner,Pole
Position,Final Legacy,Moon Patrol,Robotron 2084 ...

All these games are NTSC and PAL compatible although Lode
Runner/Davidï¿½s Midnight Magic have no color on PAL systems.

Yeah that sounds right. The only 8bit I remember that used 4416's was the 600XL. That could be upgraded with 4464's which perhaps could be used in the XEGS. Could someone with an XEGS confirm this? I never owned one myself among my 8bits.

The english isn't great (but better than my german) but it sounds like this is a pci board that will allow one to read Atari disks (and many other types) and connect two Atari joysticks (and other 9 pin types). Maybe someone else can take a look and give an evaluation...

The Zip drives will not work on an 8-bit interface. I don't think the MyIDE
and SIO2IDE are 16 bit. If they are, you will need to set up the Zip drive
according to ATAPI protocol before you use it.

I guess he waits untill he can order huge quantities. It probably drops the
price and the postage.

Sijmen Schouten (developer of the MyIDE interface) told me his interface is
8 bit only.
Marek Mikolajewski (developer of the SIO2IDE interface) told me his can
handle 16 bits.

> see facial hairs.

Hey, give me your address and I'll send you some. :-)

> I have a picture of me at my website, not good but
> you can see my face.

I saw it. If I ever find a picture of myself that I really like, maybe I'll add that to my site.

I did a quick check. More pictures have been added to ABBUC site (go to http://www.abbuc.de click on JHV)
Choose Dieter Popps pictures. You'll land at 'Seite 2' change that to 'Seite 1' (or just click on a picture and go back 'zurueck'). You'll find a picture with 'MS' underneith it. Mirko Sobe is the guy in the front who seems to be not so happy (He was. He wrote an offline HTML browser.). The guy at the computer is Thorsten 'Mad Butscher' Butschke. I'm the guy that's bend over. (Thorsten wanted to show me his 'Bremmspunkt' game, but he had some problems getting his system to load it (his 5.25" drive didn't want to respond)).

CU Mathy van Nisselroy

PS there are more pictures of me. I just picked the first one I found.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Howdy folks

How about this one:

I usually take along some disk so that I can move stuff from the
internet/newsgroups/email to my Atari system at home.
Since a week or two, I was under the impression that 2 disk looked
suspiciously alike. I have NO clue what happen. But somehow, a PC has
managed to partly overwrite the directory of one disk onto the next. Isn't
this nice....

>But somehow, a PC has
>managed to partly overwrite the directory of one disk onto the next. Isn't
>this nice....

Sounds like write-behind caching. Possibly the program that wrote to the disks
doesn't close the disk device properly, or maybe even a disk handler bug in
Windows (although that would be unheard of, wouldn't it...)

5797. Let's talk about the MyIDE Interface...

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-29 13:44:35 UTC
From: Mirko Sobe <atarixle@12move.de>
Message-ID: <apm28p$2mrv$1@innferno.news.tiscali.de>
Source record: 26268

I bought it at the JHV (gtx2all) and I like it. Bad, it want not work with Turbo-BASIC aslong I have to load the drivers from disk. Now I rediscovered ATARI-BASIC, witch works best with it (like all 48k software).

Who has bought this interface?

What do you think about the handling?

Mirko

5798. download atari software

Newsgroup: comp.sys.atari.8bit

From: Russ Gilbert <russg@en.com>
Message-ID: <3dbebd92$0$1447$272ea4a1@news.execpc.com>
Source record: 26271

Long ago, I wrote a utility to set the density on
my Ranas. There is a poke address, I think.
Then other programs I wrote would test the density
by issuing a read sector command. If it resulted in
an error (I think I set 128 bytes/sector for the SIO
read), then it would switch to 256 byte sectors.
I think error 138 results if you do a SIO sector read
specifying 128 bytes and it is a 256 byte sector.
A SIO read sector isn't that hard in BASIC. You set
up the device control block then do a SIOV call.
No, device control block is for CIOV calls. Dang
what is it? SIO does sector stuff, CIOV does file
stuff.

I use to have this happen back in the old DOS (Pre-Win9x) days. Frequently, if you didn't do a ^C
after changing floppies, it would do this. I believe it would not realize you changed floppies and would
just work with the directory it had cached in memory. I haven't seen this behavior in a long time, but
I also do not use floppies that frequently anymore.

Hello all...

I've found an Atari 1010 tape player for my 800XL... By I don't have the PSU for it, and I don't know which is its voltage. Does anyboy know it?

And another question: some time ago I was searching in Google and I saw a site that claimed to have .wav files of Atari 800 games (I suppose they were .cas games converted to .wav games). Does anybody know if this site already exists, and which is its URL?

Thanks in advance...

Regards

The OS-9 that this newsgroup is about is Microware's OS-9 embedded
real-time operating system. It's an OS that has been around about
four years longer than the Mac (1980 was when it first came out for
the 6809 processor). You might want to search www.macfixit.com or
visit the forums at www.apple.com -- tons of great searchable answers
there.

Hi All,

I built mine. What I did was solder a wire wrap socket to a perf board and cut the legs just long enough to plug into the atari rom socket- then plug the rom on top of that, and solder the interface wires to that. so it literly plugs in internaly. only 3 signals are not present, nothing 3 wires wont take care of. I like it. sure some things dont run..but it makes for good storage. I get a big kick out of seeing the LED fliker..that reminds me, I also used a bi-colored LED for the power indicator to show disk activity yellow for power on and orange for disk activity. I want to try it out with the rom based driver..but no eprom burner..ohh well

Which drive is reporting the anomaly? I had to replace a PC drive which
displayed this behavior of not realizing a disk swap had occurred.

I have also encountered A8 floppies where the directory or VTOC was invalid;
you may need a good long session with DiskTool.

I have three of these very nice interfaces. I think it is pretty smart, but the software Mr. Atari (sijmen) wrote for it needs big improvements... the interface is worth it. Sijmen is busy with that, but I am too.

I have already a working partition program that let you switch partitions and work with a partition table of 28 partitions (that will be 255 in future versions)

I have the MyIde with a 1,6 Gigabyte HD and I have several 16mb partitiions. One partition with Bewedos and one with MyDos. I saw Turbo Basic didn't work. But I guess the MyIDE is in fact only REAL interesting with a OS in ROM. There are really TOO MANY programs which are using RAM under the OS (that's where myide SOFT patch is loaded too)

My Opinion: MyIDE definately rulezzz the stars out of the atari 8bit. But we definately will need a Rom with the OS in it.

Stay tuned for my software. I'm working very hard on a Machine Code version of the partition loader, which won't need an external file anymore (so you can start that partition program from any location, because the partition list will be saved on cylinder 0 of the HD).

Newest option in my software is a format-routine, which let you format your Partition in MyDOS or Spartados format. Very handy IMO.

Greetz.

Yes, but that sio2ide won't run with Zip Disks because of some strange
format incompatibilty (believe me I tried it in 1000 ways)

Btw. An ATAPI/IDE zip drive won't boot without any OS modification on a PC
neither :-(so the IDE zip drives REALLY SUX.

>Ptros

Well if you get the monitor cable made by Commodore, you can hook
up the 130XE to one of two Commodore monitors. A guy in my Atari
group does that. Or you can also buy a video converter like I did
and hook up your 130XE to a SVGA monitor. You then run another
line into a speaker for sound. Works great for me.

5811. Atari floppy dual drive ?

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-29 22:09:04 UTC
From: bill malcolm <wm65805@alltel.net>
Message-ID: <3DBF081E.C401BA42@alltel.net>
Source record: 26282

I have a Percom disk drive for my atari (uses that serial buss) model
is RFD44-S2
It has 2 dual sided floppy drives -- rare for the time when apple and
tandy were selling only single sided drives (dates on drives are 1982)
Does anyone have any information on it.

I works ok -- I tested it back in 1998 , bought it in 1996.

thanks.

5813. shareware vs. freeware (pros and cons)

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-29 23:05:30 UTC
From: rtdos@rocketmail.com
Message-ID: <a9758358.0210291505.5dc14b63@posting.google.com>
Source record: 26284

http://groups.yahoo.com/group/rtdos

Does anyone really make any money (besides enough to buy a family meal at the local five and diner) off Atari shareware anymore or are we killing the Atari community here by not releasing some stuff as freeware (but not PD) ?

Would open source (maybe or maybe NOT GPL or some other license) help the Atari community ?

Those who no longer write software programs for the Atari, do we petition them to release their products to the Atari community as freeware so that they can still be enjoyed or used by the rest of the Atari users ? How ?

Do we write programs for the Atari because we love to program, we love Atari's, we still care about the Atari community as a whole, or to make a quick buck to take to the local McDonald's and buy a Happy Meal?

What happens to these progams after we die ? DO we release them to the Atari community or do we see the Atari community going the way of Atari Corp?

I, myself, have no problem with shareware. To me, it helps support the time and effort a lone programmer has taken in developing the program (versus the teams of programmers who slave for corporate software companies like Microsoft & Adobe). But I plan on releasing rtdos as freeware / open source in an effort to help the Atari community and because I love my Atari & love to program my Atari. However, that is my opinion. Everyone has differing views on shareware. No problem here.

I remember when I first got my 800XL & 1050 disk drive (1984). Boy was I in heaven. I was up for nearly 72 hours straight just playing with it, experimenting with it. Damn it was fun, wasn't it ? When you first took your Atari out of the box and plugged it in ? It's a sense of euphoria that you can't describe and that even can't be repeated with today's computers. Hence, another reason I am creating rtdos for the pc / intel platform. (although I would like to see it converted over to the Alpha RISC processors)

Since then, my collection has included nearly every eight bit totalling about 3 dozen complete atari systems (with drives and / or printer or printer interfaces per system) and TONS of original software as well as Atari Pong systems (pre-2600VCS) and just about every model of the Atari 2600 and including a few Atari 5200 & 7800

systems.

Unfortunately, I cannot hook up a single system as I do not have the room. Yet, another reason I'm working on rtdos. Now a days I am confined to running my Atari software on emulators (not my original collection but what I can download).

Lately, I resorted to purchasing an 80486 laptop (75MHz 8 Meg RAM 500 Meg HD) off ebay, installing MSDOS 6.22 (but stripping it down the the bare minimum) and the last free version of XFORMER for DOS. I use Atari800Win Plus on my Dell desktop at home. The laptop gives me a small sense of using a real Atari, sorta, but when you are addicted to your Atari you gotta do what ya gotta do, right ? :o)

I installed as much Atari stuff on the latop that I could fit. Now I spend less time on my desktop and most of my time on using my latop. :o)

Later I'll post a follow about using the latop as my Atari replacement if you are interested.

Back to the original story, would open source (maybe or maybe NOT GPL or some other license) help the Atari community ? Why should we tell others about our programming accomplishments if we are not willing to share them ? If we are not going to continue supporting a product (i.e., updates, upgrades, patches, new versions) shouldn't we release it as freeware (not necessarily PD) ?

What are the merits of keeping any eight bit software as shareware and not releasing it as freeware? Like I said, your opinions on shareware will vary and if it is your product it is your decision, but rtdos is and will always be freeware / open source.

I'm developing rtdos as freeware / open source, not just to benefit the Atari community (or even the other eight bit communities) but that so the Atari community as a whole can aid in its development and not limited to a few "elite" programmers as some Atari programs have been.

I can be an ass here and say that if you don't agree with my views on Shareware vs. Freeware then don't bother using rtdos and don't bother contacting me aboutit. But I won't. :o)

Because that is not what this community is about. Never has been.

How many Atari software authors quit writing programs for the Atari, not due to the pirates (have some have claimed) but to the child like actions of some? Are we gonna let those few destroy this community? I hope not. rtdos, I hope, will be a small, but much needed and effective solution. Hopefully, once rtdos is released, other solutions will follow.

How many Atari users gave up their classic systems due to lack of support from this community (rather than lack of support from the corporate culture) ? Are we killing the Atari community by holding

onto the shareware concept rather than the freeware concept (but not PD) ? Again, I hope rtdos will help play a major part in the solution.

Opinions ?

5814. Re: Let's talk about the MyIDE Interface...

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-29 23:08:11 UTC
From: Mirko Sobe <atarixle@12move.de>

Source record: 26285

I think, there will be many software updates in the next times. It seems, that Mr Atari wrote the software for himself to make the interface work. When the interface was working, he made a simple user interface for his great product (I think, that's the reason, why FDISK and SCANDISK are BASIC-programs).
When the new OSROM is ready, and Turbo-BASIC works, I would write a partition program in Turbo-BASIC or may be for BOSS-X.

On 29 Oct 2002 at 13:22:09 -0800, "Mad Atari User" at rocketmail
dot com scribbled:
->Does anyone know how option N. DEFINE DEVICE works in ATDOS 1.0 ?

It doesn't. According to the book YOUR ATARI COMPUTER, by Lon
Poole, that option wasn't implemented.

By the way, you're not using 1.0, are you? Atari Dos 1.0 was an
early, primitive version. During the years when Atari 8-bit computers
were actually used, the standard was version 2.0 (and compatibles).

As I recall it used 9VAC. The same P/S that the 400/800/810/1050/etc. used will work fine. I think it came with a smaller one similar in size to the one used for the 2600.

Source record: 26289

I'm going to be doing a shoot of the Atari 'stuff' I've amassed. I'm looking for some cassette tapes. Not just any old tapes tho...

Does anyone remember in the '80s there was a sudden appearance of audio cassettes that contained little metal reels inside to make them look like miniature reel-to-reel tapes? I'll pay good money if anyone can send me some (I'm in the UK but I'll even cover international postage costs).

Ebay is a dead loss for these, I've searched for a while now.

Sorry for being so off topic here, but the Atari community is one of the most helpful groups in general!

TIA, Dunx

Hey, if you say so..... :-)

> Btw. An ATAPI/IDE zip drive won't boot without any OS modification on a PC
> neither :-(so the IDE zip drives REALLY SUX.

The clue might be in the ATAPI part.
BTW finding info on IOmega stuff aint easy. But I did stumble into
something funny. It seems that the parallel port version of the ZIPdrives
are really SCSI drives that have their SCSI commands and stuff converted so
that it will fit over the parallel port cable. This ofcourse explains why
there are/were ZIP drives that would autodetect if they were connected to
the parallel port or to a SCSI controller.

Howdy Ron, folks

Ron : "I had to replace my PC drive to correct that fail to notice disk swap problem. I am unsure which system Mathy is encountering the invalid directory. He may just need a good session with a disk repair utility on the A8."

My PC floppies 3 three different systems:

a) one out of 18 of the computers here in the computer pool at the U. It's running Windows 2000 IIRC, not sure about the processor, but the computers have been delivered just over a year ago.

b) my Dad's PC. It's running Windows 95 on a Pentium. I guess it's a Pentium one at 166MHz or something like that. (My Dad only needs/uses it as a fancy typewriter)

c) My XE system. Running a 1.78 MHz 6502C and MyDOS 4.55 (beta version) plus BBXFER 1.9.

IIRG I first smelled something funny when working on 'a)' (the time the computer needed to find or save something was longer then usual) . But I didn't really see the resemblence between the disks before I used it on 'b)'. So it wasn't just the stuff that was displayed on screen, the directory ON THE DISK got mangled.

Howdy Ron, folks

> I have also encountered A8 floppies where the directory or VTOC was
invalid;
> you may need a good long session with DiskTool.

O yes, but fixing an A8 disk is easy. A lot of work, but easy. As long as
it's not a Sparta or BeweDOS disk.
Is DiskTool for the PC or A8?
I guess what we really need is a PC disk sector editor that runs on the A8.
And that can also copy from PC disk to PC disk.

Source record: 26296

Howdy folks

I bought my third Atari mouse on the last JHV of the ABBUC.
And guess what. It was different from the first two.

I now own two ST mice and one Atari PC mouse. The mouse balls are the same
and the thingy keeping the ball from rolling over the floor are the same.
The rest is totally different. Even the top is different. Where one top
has a plastic nose here, an other might have none or one in a different
place. One ST mouse has a connector to connect cable on PCB together, the
other two haven't. But Best Electronics already mentions that there are
atleast 8 or 9 different ST mice. Maybe PC mice are just converted ST mice,
but something tells me they are not.

My question:
Can I convert an Atari PC mouse to an ST mouse. I know I'll have to replace
the cable. (for those who read Dutch, check out the last Pokey magazin that
came out (years ago))

BTW an ST mouse needs a resistor to make the 8 bit Atari recognise the right
mouse button. And to my surprise, on both ST mice I have it goes between
the red and white wire. (pin 7 and 9) The resistor should be between 4k7
and 18k (Ohm) and give you a value of 9 or lower when the right mousebutton
is pressed (PADDLE(0) or PADDLE(2)). This does not have an effect on the
'mouse button unpressed' value or on how the ST reacts to the mouse. (I
don't own an ST).

5826. Re: IOMEGA ZIP drive and IDE interfaces

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-30 14:18:16 UTC
From: Marek_Mikolajewski@hoga.pl
Message-ID: <a2241a6e.0210300618.6bd3489e@posting.google.com>
Source record: 26347

This is very interesting form me, how the IOMEGA ZIP drive is
accessed?
With my SIO2IDE interface (ver 3.X & 4.X) two main classes of IDE
devices can be used:

- IDE ATA devices with 512B sectors, FAT16/FAT32 file system (HDD, CF
cards etc)
- IDE ATAPI devices with 2048B sectors, ISO9660 file system (CD-ROM
drives)

I am afraid that IOMEGA ZIP is a IDE ATAPI with 512B sectors.

It is very easy to add IOMEGA ZIP drive support but I don't have any
for testing. I can send to someone simple detection software that will
help me to find IOMEGA ZIP drive parameters.

If you want to help me please contact me directly.

5828. *POLL* Can shareware still play a viable role in this community?

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-30 18:18:25 UTC
From: rtdos@rocketmail.com
Message-ID: <a9758358.0210301018.22d4391d@posting.google.com>
Source record: 26349

I'm conducting a small (unscientific) poll for the rtdos operating system project to help me better understand this community and the classic systems I hope that rtdos can support. rtdos is and will alwaysbe itself freeware & open source. The two questions I've asked are:

1. Do you think this community as a whole would benefit if more "old" commercial or even shareware programs were released as freeware or into the PD?

2. If a shareware (or commercial) author has released his or her programs as freeware or into the public domain, would you still support the the author (i.e. send a monetary or gift donation) for the time and effort he or she has put into the programs?

YOu can post your comments here or on the following groups:

http://groups.yahoo.com/group/appleswapnshop/

http://groups.yahoo.com/group/atariswapnshop/

http://groups.yahoo.com/group/classicemulators/

http://groups.yahoo.com/group/commodoreswapnshop/

http://groups.yahoo.com/group/cpmswapnshop/

http://groups.yahoo.com/group/msxswapnshop/

http://groups.yahoo.com/group/timexsinclairswapnshop/

http://groups.yahoo.com/group/tiswapnshop/

http://groups.yahoo.com/group/trs80swapnshop/

(links MAY wrap)

I really would like to know what this community thinks and how we can convince authors who no longer support their programs to release them as freeware (or in the public domain) or how we can continue to support authors who still write programs for this community?

I believe this thread was about Atari's handling of Floating Point.
No need to point to a generic FP routines. Or maybe you're an expert on FP?

Freddy.

IMHO:

1. Yes, that would be a good idea. I did the same with Mega Magazine. It was sold for some years and then made freeware (distributed e.g. on the Pooldisk CD).

2. No, not for the same program. However, if there's a new version, e.g. an upgrade or new features, it would be a new piece of software and the author could ask a little amount for his/her efford. But then again, it would classify as shareware, so in that case the old software would become freeware and the new (updated) software shareware.

Freddy.

It should be in the FAQ for this group, but I believe it is pretty much the standard Atari brick; 9 Volt AC and 15.3 VA. The 800/1050 brick is a little beefier at 31 VA and should work as well...

Originally it requires 9VAC, but also runs o.k. on 7.5VAC and 12VDC to 15VDC. A standard brick from an Atari 1050 drive will also
do, as it is 9VAC.

5839. Fox-1 : 64 files per directory issue

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-30 22:56:46 UTC
From: Freddy Offenga <taf.offenga@chello.nl>
Message-ID: <OsZv9.49242$Mf5.2433884@Flipper>
Source record: 26360

H&#65533; Fox-1,

I didn't answer your question about how to handle the 64 files per directory limit with the client/server project. So, is this a problem? I don't think so. This limit depends on the file system on the server. But you have a point that the client must know what this limit is.

I can be wrong, but I think the 64 files/dir. limit in e.g. SpartaDOS is because that file system simply has not more room for more entries. I mean, when reading a directory you simply read text lines from a device. For example, you could make a dummy device handler which generates 100 times "dummy file" text lines and you would see 100 times "dummy file" when doing a directory on that device in SpartaDOS. So, that would prove that there is no actual limit on the files/dir.

Freddy.

> Who has bought this interface?

> What do you think about the handling?

The "MyIDE" requires an O.S. loaded in RAM, which is located under the o.s. ROM. This is the reason TurboBASIC doesn't run, since
it also takes up that memory area. The reason I didn't buy one is that I'm a Sparta-DOS only user, and Sparta also uses that
memory-area, so will also not run with the "MyIDE" interface. (This is also the reason I can't run BOSS-XE on my system...)

From what I've heard and read about the interface it sounds if it is a good project for those who don't use one of the above
programs (and probably some others, like Basic-XE?), but can't say much more about it since I don't have one myself...

That's a true fact. Point for you :-)
Since I always boot from harddisk I virtually never run into this...

So, to be short, Sparta-DOS works o.k. on XF551, but booting from XF551 requires some unusual actions...

As I also told Andrea, you've a point here. I always boot from harddisk so wil never run into this situation.

> And Sparta writes to $D5xx when booting. This is dangerous, since
> there may be some cartridges, that have I/O at $D5xx installed (e.g.
> the MyIDE interface).

Sparta-Dos won't run on the "MyIDE" anyways since they both are using RAM under the o.s. I guess the writing to $D5xx is to detect
available hardware, like black-box, mio and mux...

> XDOS is not PD. I've detected some minor problems (of course no FMS

Source record: 26364

Thank you Paul, Ron and Fox for your replies. The tape players works fine, thanks!

Now I have another question.

This is the story, from the beginning: I'm mainly an Amstrad CPC user, as it was my first computer. In the CPC scene, every game or utility we had on tape or on disk is dumped in an archive that can be used with an emulator, mainly for preservation purposes. It's meant to be a comprehensive labour, and is done with every piece of software, even with crap games and amateur software; and I know that it's being done also in the Sinclair Spectrum scene, for example.

Now, the question: I've two tapes for the Atari. They were given free when you bought an Atari 800XL in Spain. These are a computer's course for beginners, and it's really nice, and hilarious!. As they are in spanish, I suppose they are quite rare, and I wonder if it would be appreciate in the Atari scene to convert them to .cas files (as it would be for the obsessive and maniac Amstrad and Speccy users ;-D).
If so, which program should I use?. I've downloaded wav2cas, but I don't know if it's the only program to do this, or there are more.
And I have another problem: the program I want to convert to .cas has a *spoken* speech which explains the basic commands of the computer as they appear in the screen. I think the speech is recorded in one of the channels of the tape, while the program is in the other channel, and it loads while you hear the speech. I don't know if it can be possible, and I think that it's very strange, as the tapes of all the 8-bit machines I have are mono. Are the Atari tapes stereo? if so, can be saved the speech along with the program, to use it with an emulator? I suppose I can't save the speech "inside" the .cas file, but as a .wav or .mp3 file... does anybody know if the speech and the .cas program can be synchronized for using them with an emulator?

Thanks in advance...

regards from spain

jaime, aka johnny farragut

The Atari cassettes are definitely stereo so that voice can be on one track
and data in the Frequency Shift Keying format are on the other. I can't
answer many of the remaining questions.

Ok, I just remembered the 600xl ram cause a friend helped me out with the info on doing an internal 64k upgrade for my dads 600xl about 6 or 8 years ago. It also used 4464's in place of the 4416's in there originally

I think its a good idea to release stuff as free ware or donationware, in fact maybe we could help dig up some old commercial releases and their original authours could do the same thing.

> I remember when I first got my 800XL & 1050 disk drive (1984). Boy

> repeated with today's computers. <some more stuff snipped>

I remember the first time I used an 8bit, a 600xl I'd rented for a week in high school march break. The first time I bought an 800xl a few years later and I had a similar experience. I've spent more than one night at the keyboard thinking "just another 10 minutes" to look out the window and see the sun coming up. It may seem odd to some but I was so excited the first time I bought my own computer I even rememember tiny details like the smell of the polystyrene foam in the box.

I too like fiddling aroudn with the less common version of dos. Usually I go with mydos 4.5 for most of my stuff
but tis still fun to try the others occasionally. I did have dos 1 for a while, it came with my drive which I'd
bought used in the late 80's. I still have the drive but have lost my only copy of dos 1. Could anyone email me a
dcm of it?

ttyl,
James

Yes, the software would find excellent homes be it in real or image format. The end results is the same..Its enjoyed.

Also there would be a non argued reason to have Net archives like almost every other system. I fully understand that others own copyrights etc but in all fairness, how many actually use their ownership in a genuinely productive (for them) manner.

Most get sat on and the software rots away.
>
>2. If a shareware (or commercial) author has released his or her

Without sounding mercenary, I'd support the author via normal freeware / cardware ideals but money for many isn't a freely available option. This is software that's been sitting in copyright limbo for tens of years, say the author decided to release a new title THEN I'd be happy to pass my money towards them.

After all my years in Atari (both hobby and work) and on here I am still stunned there's opposition to archives and the like.

Hello all,

transfered some German disk magazines from my old 5.25 Atari disks to the
PC:

Compy Shop Magazin 03/88 (German)
Compy Shop Magazin 05/88 (German)
Compy Shop Magazin 07/88 (German)
Compy Shop Magazin 09/88 (German)
Compy Shop Magazin 10/88 (German)
User Mag 06/90 (German, successor of Compy Shop Magazin)
User Mag 07/90 (German, successor of Compy Shop Magazin)

Download from http://www-user.tu-chemnitz.de/~sgl/atari/files/ , files are
named csm????.zip and um????.zip, info also added to XL-Search (during the
next days probably). Maybe I set up a web site about German disk mags. In
case anybody has more of those mags or knows a website please contact me
...

Sven.

Source record: 26374

Howdy Ron, folks

I tried to use your routine 950 ML$="hh...." yesterday. Just having it inthere caused an error (It caused an error when I used the routine, but when I put a REM for it and used the old code back in, I still had the problem). I guess that means the new code is running into the ASPI manager. I need a lot of space for sector data and are coming very close to $8000. So I've placed a message here (see below) in which I'm looking for people who are willing and able to move the ASPI manager for me.

CU Mathy van Nisselroy

PS can you imagine. There's no maximum to the lenght of a directory, no mention of it's length and a directory entry (either file or subdirectory) can be up to 31 characters long. If I reserve 31 bytes for each name I loose a lot of space. If I use the 'turn bit 7 on on last character' methode, like BASIC does for it's variables, strings and arrays, I have to use a routine to search through a string that might take up quite som time on a long directory. (I guess there's no way around the last methode. I can't afford to waist that much memory. It's a pitty INSTR$ needs a character and doesn't have the ability to search for let's say everything with bit 7 set. Hmm, there was a routine in Atari User magazine IIRC. But where???)

This posting is bringing back the memories. I have a huge audio cassette collection, but unfortunately I can't find my ree-2-reel look alike cassettes. I used to have a few of them. The funny thing is that the tapes looked very professional but they worked like crap. There just is't enough room inside the cassette for those reels. They did look pretty cool anyways!

> this problem, but I haven't seen it yet.

Oh... the old "density shift/kick density/downshift" bug? This isn't a bug inn
SpartaDOS. This is a bug in the XF551 ROM. I have to manually upshift in
MyDOS as well. SOme picture viewers even include a "density kick" command.
So there are some newer DOSes that can detect a failed read and shift
densities on the fly to get around the ROM bug ? Cool!

Yes,

But with a built-in OS that space is free and MyIDE will be much more compatible. I'm thinking of making a gameDOS (just like MicroSpartaDOS from BEWE) to use with the MyIDE.

The nice part of this GameDOS I'm thinking of: it won't need another OS, so the compatiblity will be much better. The idea is simple: the gameDOS It has a load-only routine in it, which uses the MyIDE patch routines for that. The package will come with a transfer utility to transfer files from any spartados OR MyDOS disk to the special GAME partition. This will be very nice I guess; the gameDOS will have a VERY LOW memlo, and the space under OS will be free too.

Just ideas. But... I think it wil do.

The tapes you're talking about, Radio Shack sold them under their TRS-80
name as computer cassettes. They were probably made by TEAC and sold under
the Radio Shack name. I have one that's only ten minutes, and yeah it sticks
a lot, I think you're right about not having enough room in the housing.
I've been wanting to archive my conversational french,spanish,german and
italian tape sets, but I haven't figured out a good way to do it yet. I'm
thinking about making CAS files of the program track and MP3 of the audio,
but that's definitely going to take forever.

The folks in the TRS-80 community swear by these, I don't have one yet myself. From what I understand, they are capable of writting single density- but the bundled software has no provision for doing such. Someone would probably have to write a utility for single density disks, that's what happened in the TRS-80 world.

Mathy,

As a programmer I've looked into the ASPI thing. It sounds very reasonable to have a standard device handler for harddisk interfaces (if I understand it correctly). The only problem I have with it is that there is no good documentation about it. And I can not say the source code is well documented. Maybe I missed something?

Freddy.

You could try FrOst BASIC.... That was the BASIC that was the BASIC Frank
O. wrote before he wrote TURBO BASIC. FrOst B.A.S.I.C. doesn't use the RAM
space under the OS, as it was designed for the 800/400 series and not the XL/XE
series. While it doesn't do as much as TURBO BASIC, it is -- in its own right
-- a *VERY* nice BASIC, all by itself.

I have some "official ATARI" cassettes that are recorded in stereo. WHile
the program is loading on the data channel, a narrator is giving audio
instructions while Techno-Disco-Musak plays in the background.
Many third party tapes didn't bother using the audio channel, probably
becuase it was too expensive to support high production values????

Wasn't the standard for DOS upped to DOS 2.5 ? I rarely remember using
2.0S all that much (I think DOS 2.5 was an "official", "good" DOS ??? ...as
opposed to 1.0 and 3.0.... Was there ever a 4.0 on the drawing board ?)

Yea, I can do that. Is that your real email or has someone already
beaten me to the punch ?

HI Ron
thanks for the reply . I figured I had time to check it out later, I was most interested in finishing some apple lisa projects and collect CP/M files.

bill ..

Before DOS XE there really was a DOS 4.0 (QDOS) but antic bought the
copyright, I do believe, and published it under the Antic banner. (I
have both copies that say Copyright Atari & Copyright Antic in ATR
format)

I've tried FROST-BASIC, but I didn't work with MyIDE. RUNTIME.COM does also
not work...
But like I sad, I re-discovered ATARI-BASIC. Last few days, I downloaded
many old ATARI-BASIC programs from old magazines from this adress:
http://www.atari8bit-software.de
Here you can find many programs, witch are 100% compatible with MyIDE.

5869. reading 256bytes sector

Newsgroup: comp.sys.atari.8bit
Date: 2002-10-31 20:59:47 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <aps5i2$9gt$1@reader14.wxs.nl>
Source record: 26390

Hi!

Two questions:

First:
Is there a simple assembler routine available for reading 256bytes out of a
common double density sector?

I can read 128bytes/sector with the resident disk handler, and I want to
know how to do it with double density (256bytes/sector)

(!) I don't want to open a specific file, only to read a common sector

Second:
HOW can I detect if a sector is double or single density?

Thanks
Marius

5870. Re: Let's talk about the MyIDE Interface...

You mean WITHOUT having the software OS?

I have been thinking of that too. As you could read I'm working on a special gamedos first.

It must be possible to write a special DOS for the MyIDE interface (or edit an existing dos) But it will never be 100% compatible because some people wrote software with illegal vector jumping etc.

Btw. The drive routines are not really complicated BUT they take space. If you put these routines in a DOS the compatibility of this dosk will be less. So I prefer writing a new DOS specially for MyIDE.

Marius.

Btw. it is possible to acces the harddisk without the myide OS. You can read and write drive-info and with some tweaking you can read and write other sectors too. So it must be possible to do that.

The unidrv.obj is the routine, but this routine is stored in page 6. This routine will be the heart of my GAMEDOS for MyIDE, but I'll rewrite it and re-assemble it to another location.

If you read the documentation you'll see the locations $D100 (internal) / $D500 (external) and up are used for transfer data.

I have the idea that Sijmens interface could do much much MUCH more than he thinks. (Just like the atari people didn't believe their XL could show 256 and 4096 colours etc.)

Btw

scandisk.bas and fdisk.bas work both without the myide os.

So again: yes a DOS can be adapted/written, but I still think it will be
better to write a whole new dos. PErhaps an idea for REAL.DOS

Mrius

I think it is.

> This limit depends on the file system on the server. But you have a
> point that the client must know what this limit is.

> I can be wrong, but I think the 64 files/dir. limit in e.g. SpartaDOS is
> because that file system simply has not more room for more entries.

Sparta-Dos (2.3 /3.x versions) handles up to 127 files/dir. Sparta-Dos-X (the cartridge)
can handle more files/dir (1024?)

> when reading a directory you simply read text lines from a device. For
> example, you could make a dummy device handler which generates 100 times

> no actual limit on the files/dir.

I think listing a long dir isn't a real problem, but actually reading or writing may be.
Don't know how it works exactly...

I'm not sure, but I think those are also on the PoolDisk CD-Rom (the diskversion, not the cassette)

> If so, which program should I use?. I've downloaded wav2cas, but I don't
> know if it's the only program to do this, or there are more.

I think WAV2CAS is unique.

> it's very strange, as the tapes of all the 8-bit machines I have are mono.
> Are the Atari tapes stereo?

Yes, they are stereo.

> if so, can be saved the speech along with the
> program, to use it with an emulator?

No, afaik.

> I suppose I can't save the speech
> "inside" the .cas file, but as a .wav or .mp3 file...

One thing you can do is make an MP3 of the WAVe-file using "full-stereo" (or 2 channel) enabled, so NOT joint stereo. A bitrate of
112KBit/s should be enough (or better, use variable bitrate 64 -> 128 KBit/s). To load this MP3 into a real Atari you can use a
CD-adapter. It's a device that has the shape of an audio cassette-tape with a wire which was ment to plug into a portable
CD-player. That way you could listen to a CD in a car by using a standard cassetteplayer, but you can also play the MP3 thru your
PC soundcard and when this adapter is in your 1010 it thinks it's playing a tape, which is in fact just the audio-output of your
PC...

5880. Re: reading 256bytes sector

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-01 02:52:42 UTC
From: Ron Hamilton <oldatarian@atariland.com>
Message-ID: <_%lw9.254$7n.27201@newsread1.prod.itd.earthlink.net>
Source record: 26202

First:
Reading DD is a snap; just call SIO directly at $E459 after configuring the DCB at $0300 for $0100 bytes to transfer. Be sure to set the Status byte for proper transfer direction. Using the Resident Disk Handler at $E453 sets the DCB for $128 bytes and can only do single and enhanced disks.

Second:
See the discussion on 'Detecting Sector Size' elsewhere in this Newsgroup for use of the Status command. If you are utilizing a drive other than standard 810 or 1050 you might read the configuration block from the drive with the 'N' command. This may not be conclusive if the drive has not been reading the disk. You can always read sector 1 (always 128 bytes) before checking the configuration block and hope the drive controller auto detects and sets itself; not all drives do...

What was the error? Out of Memory? Are there any places we can conserve
bytes?

Simple matter (if we solve memory limitations and have a place to put it) to
search a string for inverse character delimiters. It might help know
structure of data such as fixed or variable length fields... Probably need
to pass it a starting offset so that it would not just keep finding the
first one like:
OFFSET=USR(ADR(FIND$),ADR(DIREC$),START)
You can then examine text before or after OFFSET and then put OFFSET into
START to get the next one after it. You can spot end of data when OFFSET
exceeds DIMed length of FIND$.

I don't understand relocating ASPI; if it autoloads in top memory and we are
bumping into it, then there is no free space left...

In that case you have to wait indeed for the EPROM from symen. Then you can work with MyDOS.

MyDOS is nice but I don't like (!!) the very large DUP.SYS and i definately HATE the location that dup is stored. You can't start any M/L program stored between let's say $3000 - $4500.

Date: 2002-11-01 06:30:49 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <apt70uqcj1@reader13.wxs.nl>
Source record: 26207

Hmmm I can't get this worked...

The next routine I wrote uses resident disk handler... and reads 128 bytes/sector, and writes that into buffer location $6000-$06080. That works ok.

```
BUFFER= $6000
SECTOR=130
LDA #$52 (lezen)
STA $0302 (command byte van het device control block van de resident disk handler)
LDA #$01
STA $0301 (Drive nummer)
lda #<BUFFER
sta $0304 (128bytes buffer adres lsb)
lda #>BUFFER
sta $0305 (128bytes buffer adres msb)
lda #<sector
sta $030a (lsb sector)
lda #>sector
sta $030b (msb sector)
JSR $E453
```

NOW I changed a few things, and now it doesn't read at all. I didn't get your point about the dstats. This is the routine now, but it doesn't work:

```
BUFFER= $6000
SECTOR=130
LDA #$52 (lezen)
STA $0302 (command byte van het device control block of the resident disk handler)
LDA #$01
STA $0301 (Drive ID)
lda #<BUFFER
sta $0304 (128bytes buffer adres lsb)
lda #>BUFFER
sta $0305 (128bytes buffer adres msb)
lda #<sector
sta $030a (lsb sector)
lda #>sector
sta $030b (msb sector)
lda #$00
sta $0308
lda #$01
sta $0309 ($0100 bytes to read)
```

JSR $e459
RTS

nothing is written at all in the buffer.

Perhaps you can edit the source to let this work.
Thanks
Marius

First just a question:
Why don't you use $E453 (DSKSIO) instead of $E459?
It sets some values for you and you don't have to care about then.
If you are using $E459:
I am missing in your code that you are setting up a timeout value for
$306, that could be the reason. And in $300 has to be set the device type
(IIRC #$31 for disk drive).
Ok, try it please:

> BUFFER= $6000
> SECTOR=130
LDA #$31 (device type disk)
STA $300
> LDA #$52 (lezen)
> STA $0302 (command byte van het device control block of the resident disk
> handler)
> LDA #$01
> STA $0301 (Drive ID)
> lda #<BUFFER
> sta $0304 (128bytes buffer adres lsb)
> lda #>BUFFER
> sta $0305 (128bytes buffer adres msb)
LDA #7 (timeout value)
STA $306
> lda #<sector
> sta $030a (lsb sector)
> lda #>sector
> sta $030b (msb sector)
> lda #$00
> sta $0308
> lda #$01
> sta $0309 ($0100 bytes to read)
> JSR $e459
BMI Error
> RTS
Error: check value of $307 which tells you the reason

Sven.

Your Creative Atari is an excellent sourcebook for offbeat ideas --
hardware and software. Written by David and Sandy Small (who went on
to produce the Mac emulators for the ST world).

But my all-time favourite and one that I consult constantly is Mapping
the Atari by Ian Chadwick. Fantastic! Inspiring! The appendix
featuring patches to the OS (especially MatRat's ROM to RAM patch) is
why I wanted to start programming...

The Hofhacker books are good too... but weird (maybe it's the
translation?).

What about magazines? Antic or Analog? Or for those in the UK: Page 6
or Atari User?

I adored the US mags but they were expensive and, as a student, I
found it hard to justify the cost.

Jerry

(the cartridge) can handle more files/dir (1024?)

Ok, I thought it was 64, but that's the Atari DOS limit then.

writing may be. Don't know how it works exactly...

Reading a dir. is simply getting text lines with entries from the device
handler. It could be a problem for applications which hold the dir. in a
buffer, so that the buffer can not be large enough.

If you don't know how it works, why do you insist there is a problem?

Freddy.

This is interesting. Do I remember correctly that it was possible to have
the program loading while music played? Is this because the program is
stored on the left track and the music on the right?

Such 'music + program' tapes can not be preserved with the CAS format. Would
it be possible to store those in a stereo WAV file?

Freddy.

Popular amongst Amiga users, Alows them to read Amiga format floppies on
their UAE/Amiga emulator software running on a windows/dos system.

may have simmilar uses for running atari emulators on such a box.

Because the DSKSIO is an internal disk handler. In fact this is a driver.
This driver only supports 128 bytes/sector.

Ohw I get that dskstats thing!

Thanks for your help.

if i do this:

LDA #$40
sta DSKSTAT

it works.

Yes, 64 is Atari-Dos (and compatibles) limit.

Yes, some apps can only hold 64 entries (like MegaPlayer, AtariWriter, Panther, etc) but
this is an application-incompatibility,
not a DOS one.

> If you don't know how it works, why do you insist there is a problem?

I do not insist there is a problem. I _think_ there is a problem with the limits.

I'm simple minded and just ask myself:

"Why Does DOS Has A FileLimit, and Why It's 127 Entries In Sparta 2.3/3.x, While It's Much
Higher In SpartaDos -X-, Where Both
Versions Are Format-Compatible?"

A good answer to this and I'll change my mind :-)

As long as the audio-volume is okay you won't loose anything. The critical part is the tape lead-in, but any bitrate above
96KBit/s will do.
VBR has the advantage you'll end up with a smaller file-size, but causes a slightly higher CPU-load when playing on PC.
Just remember to use "Full Stereo", not "Joint" stereo as the Left/Right channels may not be mixed! (which does happen when using
joint stereo)

Message-ID: <Pine.GSO.4.44.0211011655250.12728-100000@shell1>
Source record: 26225

On 30 Oct 2002 at 10:18:25 -0800, "Mad Atari User" at rocketmail
scribbled:
->>I'm conducting a small (unscientific) poll ... 1. Do you think
->>this community ... would benefit if more "old" commercial or even
->>shareware programs were released as freeware or into the PD?

Yes, because the opposite answer isn't viable. Releasing old
8-bit programming can't hurt. On the other hand, any attempt to
"hold" on to "rights" for old programming can't help.

The point is that there are so few people left and so little of
a "community" still surviving for the Atari 8-bit, that there's no
useful purpose served by taking a high-handed attitude toward "rights"
to old 8-bit programming. There's no market left, so those rights
aren't worth anything.

->>2. If a shareware (or commercial) author has released his or her
->>programs as freeware or into the public domain, would you still
->>support the the author (i.e. send a monetary or gift donation) for
->>the time and effort he or she has put into the programs?

That's a moot point because you won't find an address to send a
payment to, even if you wanted to. Remember, we're talking about OLD
8-bit software here. That means stuff put on the market 15 or 20
years ago, or in rare cases, maybe "only" 10 years ago.

Companies that were in business 15 or 20 years ago (in some cases
as far back as 1981 or 1980, which means up to 22 years ago!) are
long gone. And individuals who published or released programming on
any kind of basis have likely moved half a dozen times, changed
careers (not to mention platforms), and are likely to be almost
impossible to trace down. This is true not only for people involved
in the Atari 8-bit scene 15 to 20 years ago, but also for people
who put out shareware for other older platforms.

In reply to this same thread, on Thu, 31 Oct 2002 at 03:51:58
+0000, Paul Irvine of YOURFINGER dot internet scribbled:
->... say the author decided to release a new title THEN I'd be
->happy to pass my money towards them.

That's the only practical way. We're not going to see much new
output from people who published Atari 8-bit programs 15 or 20 years
ago.

Only possible when your harddisk is small enough. DCM handles up to 9999 sectors, so a 16MB partition (65535 sectors) will not
work...

Ok, that was not the question and I don't have an answer to this one. Maybe there are slight differences in the format, that SDX uses larger blocks to store directory entries, I don't know.

Back to the original question. :) You asked how I would solve the max-files/dir. limit of the current Atari DOS. That limit can exist because:

1) DOS keeps the whole directory in memory, so this is in fact a 'not enough memory' problem.

This is not the case. AFAIK DOS conforms to the CIO routines for directories. The entries are taken in memory line by line and e.g. output to the E: handler. If some application wants to get the whole dir., it must get it line by line (or the dirty way, reading sectors).

2) The directory entries must be stored somewhere (e.g. on a disk/HD), so the limit is caused by the size of the block where these entries are.

Eventually the entries must be stored somewhere on the server. If the file system on the server is mapped to the Atari, then that system dictates the limit (which is probably high enough anyway). So, this second point is also a non-issue.

What I said before, that the client (Atari) should know the f/d limit is probably a non-issue too. When a directory is full, the handler will give an error message to indicate this.

Freddy.

Source record: 26228

Ron, that's a good one! :-)

Mathy, I don't know how big the blocks are you're loading, but if you're reading a directory and the memory is full, you should first process that part and then continue. E.g. you could read 20 entries into memory, let the user pick from that list or continue to the next 20 entries.

Can't you use an escape character (e.g. 0xFF) to find the end-of-string with INSTR$?

Freddy.

From Ron:
> I don't understand relocating ASPI; if it autoloads in top memory and we are
> bumping into it, then there is no free space left...

From Mathy:
> > PS can you imagine. There's no maximum to the lenght of a directory, no
> > mention of it's length and a directory entry (either file or subdirectory)
> > can be up to 31 characters long. If I reserve 31 bytes for each name I

Cool! Can't wait to play those! :-)

Have you made any CAS files? I like to try this with some of my tapes.
Should I just connect a tape-deck to the line-in of my sound-card and sample
away? No tricks there?

Freddy.

> the E: handler.

That's a fact. Another fact is that Atari-DOS uses "file-numbers". Besides the filename, there is also a number in the VTOC for
each file. The max. number is probably 63 :-)

> 2) The directory entries must be stored somewhere (e.g. on a disk/HD), so
> the limit is caused by the size of the block where these entries are.

For Atari-DOS, yes. Sparta-Dos places this info more or less all around the disk when using subdirs. I have no idea if there is a
pre-defined size of each created directory, or if it's a variable size. If it's predefined, it's clear now why there is a max.
file-limit :-)

> What I said before, that the client (Atari) should know the f/d limit is
> probably a non-issue too. When a directory is full, the handler will give an
> error message to indicate this.

Yes. You can't place more files into a dir then a DOS allows to. Now I wonder what kind of error I'll get with Sparta-Dos 3.3
when reading a 1000 files directory created with Sparta-Dos-X...

Only some for testing. It works.

> I like to try this with some of my tapes.
> Should I just connect a tape-deck to the line-in of my sound-card and sample
> away? No tricks there?

Yes. That's about it. Only trick is you can't convert "Turbo" cassettes this way, like those saved with TurboTape, Turbo2000,
RamBit, etc... (an example is the game "Humanoid" from "Mirage". I had a hard time to get it to disk :-)

5911. Displaying 8-bit Atari on PC

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-02 04:23:55 UTC
From: Phee <ptros@yahoo.com>
Message-ID: <zkIw9.15325$46.7901@fe01>
Source record: 26232

I'm looking for a way to display my 65xe on my Windows PC monitor using some kind of USB device. My PC has issues with any additional PCI cards due to sharing problems, hence why I'm exploring a USB solution. Perhaps a Dazzle 50? Not sure if the Dazzle 50 will display the Atari using Composite video in real-time or if it simply captures.

Any ideas?

Phil

5913. NEW - 'Products by e-mail' service from DGS

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-02 13:16:39 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1036243052.58046.0@damia.uk.clara.net>
Source record: 26234

Hello All,

Today I launch a new way of buying commercial products from us. 'Products by e-mail' allows you to buy commercial Atari 8-bit products from us at minimal cost. Instead of a physical shipment, the products you choose will be e-mailed to you as a ZIP file containing both ATR and DCM versions of the disk, along with a manual in text format (or PDF if the file is small enough). You can order on-line using your credit card (using PayPal). This now allows you to order products at a much reduced cost, and to have them within 24 hours (usually less).

At present, only a few of our products are available on this service, but more are to be added soon.

Prices start at just US$2.

Please visit the website at http://www.dgs.clara.net and click the 'products by e-mail' button.

Dean Garraghty

1. Absolutely yes; any applications not currently being actively supported
should be relegated to PD or FW. Utilization of software should be
encouraged as it requires hardware or emulation and it will enlarge and
strengthen that platform community.

2. Depends on the app; most of the coders I know are hobbyists like myself
who expect no return for our efforts. I will donate to authors for software
that I like and use.

(1) It's a viable option. There is little or no money to be made (any longer) for commercial and shareware programs. Retro/Hobby disc-sets might be the exception to the rule but then you'd be charging only the necessary amount with perhaps a slight bit left-over to (hopefully) further benefit released software in the retro community. Would probably just make more sense to transfer old commercial software into PD/Freeware.

(2) New program, new copyrights, new "technology". Revised, recreated, and completely new software could certainly fall into a variety of paid-for-software categories. Due to the hardware itself being over a decade old, it might be difficult to market new software products to the retro/hobbyist crowd. Support for the author is also viable and could be done in many ways. There is a great amount of volunteer support in the open-source communities and gives wonderful provisions to everyone. I would see very limited support in terms of a strictly financial sense but a tremendous amount support from other avenues.

Great questions!

Source record: 26238

Oops; misconception of 2.0 disk structure. The VTOC sector is merely a bitmap of which data sectors are free and available for use plus a recap of their totals.

The only place the file numbers appear is in the final 3 link bytes of each data sector; they appear in the upper 6 bits of byte $7D for SD/ED or byte $FD for DD and they reference the position of the file's entry in the directory sectors. Entries 0 thru 7 are in the 1st directory sector 361 and entries 8 thru 15 are in the 2nd sector 362... and entries 56 thru 63 are in the last sector 368.

The lower 2 bits of byte $7D/$FD plus all of byte $7E/$FE evaluate to the sector number of the next data sector in the particular file (zero means EOF). DOS checks the file number of each sector in the chain as error control and responds with #164 File Number MisMatch when it fails.

Hi All! Wrath here. Like so many others I have a collection of old Atari softs, on carts, disk and disk image. I still have my hardware (1200XL, 800, 800XE, one (1) working Rana 1000 drive) so the carts are not a problem.

No, my problem is compatibility with the emulator. So few of my images work and of these, my most favorite games (Mule, Alternate Reality, Wizard's Crown, Ultima) cannot be made to work.

Well, that's with my limited abilities I guess.

Has anyone had any luck getting multi disk games (like Alternate Reality) to work with an emulator?

Why run this programs on emulator when you have the real machine? When you download games on image format use APE or SIO2PC to boot them with your REAL ATARI no problems and more fun...

I believe that the author, himself, came onto this NewsGroup and did it himself many years back. You may want to check out a DejaNews archive. The author explained his ingenious copy-protection system which had something to do with the Vertical Blank Interrupt losing synchronization or something. He then stated that he had a "corrected version" up on the net. I can't remember the address. You may want to check out the archives at the University of Michigan. That was one of the big ATARI archives back in the day....

Not exactly correct. Gary Gilbersten<sp?>, the composer, came by and said as far as he was concerned his songs could be distributed. I also phoned DataSoft when they were still in business and got permission to copy the map from the hint book as they were sold out and didn't plan on making another run.

Philip Price came by the newsgroup and said he has the rights to AR. He was planning an AR online game circa 1997 to compete with Ultima Online, EverQuest, etcetera. The game was supposed to come out circa 1998 so it doesn't look good.

Hi Freddy,

ATARI-DOS 2.5 reserves sectors 361 to 368 for the disk directory. In
SD the size of the directory is 128*8=1024 bytes. Every directory
entry has a length of 16 bytes, so you can store up to 1024/16=64
files on a disk, as Ron explained.

Under SpartaDOS, directories are simply ordinary files (but of course
managed by the DOS), so theoretically there is no size limit and the
directory can be stored everywhere on the disk.
SpartaDOS X and Bewe-DOS limit the size of a directory(-file) to 32KB.
Since every directory entry has a length of 23 byte, there will fit
32768/23=1424 files in a SpartaDOS directory (subtract 1 for the info
entry at the start of the directory).
(SpartaDOS 3.x can read only the first 126 entries of a directory.)

SpartaDOS has like ATARI-DOS a VTOC (sector bitmap of used sectors).
The sector links are stored in the file in extra sectors, called
sector maps.
See ABBUC-Sonder-Magazin 16 for details on the SpartaDOS disk
structure :-)

Stefan

Thanks Stefan. I'm aware of this info. :)

The block-size you mention is not important for me, since I'm not using the
Sparta file-system. I'm limited by the file-system on the 'server' (the PC).
In other words, I was interested in the API and not in the method of storage
itself. Ok, just wait for the project document. :)

Freddy.

P.S. That's the project _after_ ATP ! ;-)

I have seen a couple of notes about this BASIC recently. I have a version of BASIC that is listed as "Turbo Basic 1.4" that runs on the 400/800. It is 132 sectors long (on disk), and produces a FRE(0) of 22766 bytes (or almost 7K less room than Turbo Basic XL According to the docs, it pretty much duplicates all of the features of TB XL. Is this the FrOst BASIC?

Source record: 26301

Hi there,

Guus Assmann is working on a new floppy hardware for the atari 8bit.
We have set up a discussion on
http://www.strotmann.de/twiki/bin/view/APG/ProjNewFloppy.

It should be an open system, and compatible to existing hardware and
software. So we need input from all experts and users. Hardware and
software will be discussed and released open on the web.

Hello all!

I was just playing Druid but I don't seem to get into the game. How to change weapons? And, above all, what's the game's object?

Incidently, I played the C64 version yesterday and found the music quite nice. Guess what's lacking from the Atari version?)-:

Hello Larry,

yes, this seems to be a version FrOst Basic. Turbo Basic XL loads
parts in the RAM behind the OS-ROMs. This is not possible on 400/800,
that's why there is 7k less memory.

I'm not sure if there are other diffs between this versions.

> bytes?

IIRC it was an error 5 or something like that. I've seem the same happen before with the audio player utility. I had to kick out the help screen to stay away from the ASPI manager. The error number itself means nothing in this case. IIRC the line it tells me the error is at, contains something like IF A$(1,5)="CD001" THEN ......

are
> bumping into it, then there is no free space left...

The ASPI manager starts at $8000 and runs untill $8800 (it doesn't need all that space, but Matthias probably tells us so because he might need some extra space in the future). IIRC $8000 is not the top of available RAM.

the
> user pick from that list or continue to the next 20 entries.

Well, a CD ROM sector is usually 2048 bytes long. I'm not sure if directories are limited to one sector, but I guess not. So I need a big sting. I could reload the main directory everytime, but it would be best if I keep the pathtable (a list that is on each CD with all the directories that CD has. IIRC I've seen the number 127 appear in the parent directory entries) in memory at all times. That way it is easier to go back a directory. I've seen pathtables that have only two entries (the LEGO CD you get for free with two rolls of 'Prinsenrol' biscuits), and I've seen pathtables that would need several screens to show them all in an orderly fasion (sp?).

Now that you mention it....yes, there is not much documentation in/on the
code itself. Maybe you could contact Matthias at matthias.belitz@gmx.net
Maybe he responds faster when somebody else asks him some questions about
ASPI once in a while too.

BTW you understood correctly (that is, if I understood you correctly
:-))) ASPI is to SCSI and IDE what RS232 drivers are to RS232
interfases. With modems, you just loaded BobTerm no matter what interface
you had and loaded the RS232 drivers from disk or from the interface. ASPI
does/should do the same for harddisk interfaces.

Ok, I understand. Please note the mismatch driver/handler. I'm sure you mean 'handler' when you say 'driver'. The handler is the API which makes it possible to have different drivers for a certain type of I/O. E.g. you can have different drivers for the R: device handler.

So, the ASPI handler can be implemented with a SCSI driver for the Black Box. Or there can be another ASPI handler with an IDE driver for MyIDE. :-)

Freddy.

Mathy,

It seems to me that if you have a memory problem, you should not try to keep those pathtables in memory. You should ofcourse have a pointer to the current directory sector (pathtable?). And if a directory covers several screens, so be it, you can not do much about it.

For better performance you could save the path info the user asked for, so you don't have to load that when he/she is going there again (a cache buffer).

Freddy.

Source record: 26320

Hello Mirko,
I got the My-IDE interface for free (because I traded some other carts with Sijmen). About one year ago I had an XE computer with built-in My-IDe interface and it merely worked with 48k software, meaning no sparta-DOs, no Turbo-Basic XL, etc. But this (older) version also did not work with Bewe-DOS, so I had to use MyDOS. The old version was also limited to 8 drives/partitions and did not support image-loading then. Since I had 2 floppy drives connected to my Atari and a Ramdisk as drive 8, I could only use 5 partitions, which was not enough for me. Besides, some software did not work with 256 bytes per sector so I gave this computer with built-in My-IDE interface away to Jiri Bernasek. Think he has not used/tested it yet...

Nowadays I already have 3 My-IDE carts, one I traded with Nir Dary, the other two carts are still at home and untested yet. I merely added them to my cartridge collection... greetings, Andreas.

P.S.: Sijmen created the new Os called S.O.S. for both the internal (built-in) and external (cartridge) version and wrote some nice english manuals. Just visit his homepage to download them or read the printed papers...

5951. Re: shareware vs. freeware (pros and cons)

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-04 17:53:13 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DC6B408.15F5F62C@students.uni-mainz.de>
Source record: 26322

Well,
I do own some shareware Atari programs, my friends too. So far I am sure that most Atarians here in Germany did not licence any shareware programs from foreign countries. Me, I tried several times to licence some (for example the many programs written by Jeff Potter!), but mostly this happened 2-3 years after they were released. Nope, I did not wait 2-3 years to licence them, I found or got these programs so late (remember that we did not have the internet some years back!). Well, whenever I tried to licence any Atari software -as said before: years later- the authors told me that there would be no longer the need to do so, because they had already given up! Meaning no more updates or Atari support was available then...

Thus, in my opinion, if someone releases some Atari software as shareware, he should be a really patient guy and a) wait/be patient some years for the users to licence it and b) support it for the same period of time (make/create updates, etc.). But I guess, freeware is more common in these days. You can download so much from the internet and nobody cares if this atari stuff is commercial or PD. And of course nobody would care if it is shareware or freeware (most Atarians would treat it the same way, I think!). But hey, for the hobbyist who does not want to make much money, why not release his stuff as shareware ?!? Any programmer should release his programs the way he wants...
-Andreas.

Well,
nothing except they are old and funny ;-). I guess I know what he means,
at the moment I am buying CD`s that look like old LP`s (i.e. as if they
were made of black Vinyl). For the kiddies that haven`t seen LP`s or
(more likely) reel-to-reel tapes this looks really strange. For us
oldies, it will remind us of the good old days (besides, my parents
still have a Phono by Kenwood and a reel-to-reel tape by Akai)...
-Andreas.

Source record: 26324

Well,
play back the atari tapes on your hifi system and you see (or better
hear!) they are mono !
they have their data on the left channel, but: afaik they do not use the
full left channel, only half of it !! the other half can be used for
speech or music. here in germany a few firms like quelle, europa and
such used music on the other half of the left channel which sounds quite
strange on a hifi system. (thus, the right channel produces only noise
and the left channel produces sound and data noise...);

Besides, someone in Poland created a CD-ROM interface which can playback
digital data (in turbo-tape format!) to your Atari computer. this means
you have to record the data with your PC soundcard, burn it to CD and
then play/load it with your Atari and this interface (slower than
floppy, afaik turbo-tape format is limited to 9600 baud). One CD track
can handle 4 game tracks - and guess what they did, they used the
original Atari way, meaning only 1/4 is used for data (half of the left
channel is equal to 1/4 of both stereo channels!). greetings,
Andreas.

5954. Re: Compy Shop Magazines + User Mags online (zipped ATR-files)

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-04 18:31:14 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DC6BCF2.B5016C4D@students.uni-mainz.de>
Source record: 26325

Well,
the Compy-shop magazines can all be found on a) the Pooldisk Too by Bo
and Ernest Schreurs, b) the HAPS-CD and c) the ABBUC PD library. They
were made PD when Compyshop ended the Atari support. Afaik the User-Mags
by Ulf Peterson are NOT PD !! Better remove them, since Ulf or a brother
of him is a lawyer (Rechtsanwalt) and already judged many atarians who
broke his copyrights. He also once tried to judge ABBUC (allthough he
had broken copyright rules and not ABBUC!) when someone at ABBUC said,
he is selling illegal copies of PC Xformer by Darek Mihocka. (Ulf was
selling them without the registration cards, still he tried to judge
ABBUC!)... So, be warned and better take care... -Andreas.

P.S.: Some User magazines are copy protected (especially those that
contain commercial software, where Ulf bought licences for!), this
should have been a good notice for you, that they are not PD !!
Otherwise: Which PD program has a copy protection ?!?

5955. NEW - 'Products by e-mail' service from DGS

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-04 18:57:09 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1036436284.30934.0@dyke.uk.clara.net>
Source record: 26326

Hello All,

Recently, I launched a new way of buying commercial products from us.
'Products by
e-mail' allows you to buy commercial Atari 8-bit products from us at minimal
cost. Instead of a physical shipment, the products you choose will be
e-mailed to you as a ZIP file containing both ATR and DCM versions of the
disk, along with a manual in text format (or PDF if the file is small
enough). You can order on-line using your credit card (using PayPal). This
now allows you to order products at a much reduced cost, and to have them
within 24 hours (usually less).

At present, only a few of our products are available on this service, but
more are to be added soon.

Prices start at just US$2.

Please visit the website at http://www.dgs.clara.net and click the 'products
by e-mail' button.

Dean Garraghty

I'm a Systems Administrator for Ben's ISP. I dealt with the original complaints, and asked Ben to add an ADV: tag and limit his posts to one a month. I did this with the stipulation that after one month, I would reassess the situation and determine if said decision would be permanent.

I have followed the threads in CSA8 for the past 1+ month, monitored the previous complainants, monitored the "unofficial" ads posted by third parties on Ben's behalf, and have subsequently weighed these observations against CSA8's history, general USENET tradition, and the current state of the 8bit Atari. Based on these observations, I am rescinding my previous decision. Ben's ads must continue being tagged with ADV:, but I am lifting my prior decision to limit his ads to once a month. He will be expected to self-limit his ads to no more than once a week, as was his prior mode of operation.

Anyone who chooses to email complaints regarding Ben's ads or my current decision should do so thoughtfully. Any rude, vulgar, or immature email directed to me will be promptly ignored. Any email from senders who have posted rude, vulgar, or immature messages to CSA8 will be ignored.

Hmm,
there seem to be several versions of Turbo Basic, that do not use RAM
under the OS ROM (Turbo Basic XL does!). One is known as Frost basic,
the other one as turbo Basic 400 (maybe the same as Frost Basic?) and a
third one as turbo Basic 3.2q (written for Sparta DOS by Tom Hunt). So,
try one of these if you need a TB that does not use RAM under ROM area.
Well, afaik there are no patches/updates for the TB Runtime or TB
Compiler available - both use RAM under OS ROM...
But I try to avoid these two programs if I can... -Andreas.

Nope,
there were many tapes by Quelle-soft and Europa (both german companies)
which used sound during data playback. But I insist: the tapes are mono
! If I playback a data-only tape on my hifi-system, the right channel is
noise only, whereas the left channel has the data-noise; now, if I
playback a tape with data and music on my hifi-system, the right channel
is still noise only (it is unused!), whereas the left channel contains
both data and sound !! -Andreas.

Well,
it is probably a speedy 1050 with track LED ! One switch is used as a
write protection switch (write-protection on or off), the other one to
chose the built-in ROM software: a) Bibo-DOs or b) High-Speed-Sector
Copy. The track LED could display the track in decimal or hex format,
which was very handy for hackers/crackers to find the place of certain
copy-protections...
-Andreas.

5962. Re: DCM an entire hard disk ? convert to XFD or ATR format ?

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-04 19:36:46 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DC6CC4E.3A343B6E@students.uni-mainz.de>
Source record: 26333

Nope,
not -fully- possible. DCM format is limited to 9999 double density sectors (each with 256 bytes). Whereas a harddisk partition can have up to 65.535 double density sectors (each with 256 bytes). Thats why my XLE-CD contains the 16 MB partition of ATOS only in (zipped!) ATR and XFD format... (besides that the CD does not contain any DCM images anymore, because I was out of space and I prefered ATR and XFD images...) -Andreas.

P.S.: Most ATR/XFD/DCM converters for the PC (like ACVT or Imagic) are limited to 180kbytes when converting to DCM format; on the Atari you can DCM higher/bigger formats, but then its a little bit difficult to transfer these big DCM images to the PC...

5963. Re: *POLL* Can shareware still play a viable role?

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-04 19:47:52 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DC6CEE8.823D38AD@students.uni-mainz.de>
Source record: 26334

Well,
what do you think why big firms like EA, Activision, Sierra and such
still do not make their old software available as Pd or freeware ?!?
Because there is a market - on the PC or the mobile phones or the PDA`s
!! On the PC they sell remakes of old titles that include the original
version, for the mobile phones they sell or licence the original 8bit
games !!! For example Infogrames sold or licenced many old Atari games
(like Centipede, Millipede, Robotron, Breakout, etc.) to the british
firm Orange (which produces & sells mobile phones) for some 5 million
dollars... -Andreas.

P.S.: I think that only small companies or authors who already got their
rights back will make their programs available as freeware or PD. Big
Firms like Sega, Nintendo, Sony, Hasbro (which still owns Parker,
Microprose, Firebird, Silverbird, Rainbird, etc.), Electronic Arts,
Activision, Sierra, etc. will probably never declare old programs as PD.
Why?!? Well, first there still is a market for these old games, second
this would maybe lead to an avalanche (i.e. Atari users want old
programs to be PD, then Commodore, then Sinclair, etc. - and after the
8bits, users of 16 bit machines want their programs to be PD, etc.
etc.);

Yeah you should know that the MNX crew will have the power to travel everywhere.... even when we run out of gas we will return safely so we can think about the next party to come to.....

Maybe next time we can rent a plane to travel, we have done already some nice things like just buying a car to travel to Czech Republic and when we were back we sold it.... we have traveled with several different cars and vans so... the next step could be a limo, a plane and maybe in a couple of years a space ship... :-))

> Another question...
> where is Datasoft today ?!? Did someone buy them ?!? did they end to
> exist or what ?!?

Double check me because I may have the history wrong: I think DataSoft went broke and was bought out by Intellicreations or something like that. At least one of the programmers employed by DataSoft did drop by, Dan Pinal the lead programmer on AR Dungeon maybe, to say hi and wanted a bootleg copy. He was happy about AR Dungeon being available. That does carry some weight in that he was the lead programmer and can almost be called the last man standing out of DataSoft.

> what about their rights - did they go back to the authors or what ?!?

That was Philip Price's ~position as the originator of the game. He made several points about things like the failure of DataSoft to deliver on the contract. I can't remember the list, stuff like royalty payments and sequels I think.

Looking at http://www.copylaw.com/permission.html#us
For permission to quote from a >book<, you must contact the publisher's rights department. If the publisher has gone out of business, or the book is out of print, you'll need to trace the author by doing a copyright search or contacting one of the authors' organizations listed below.

At any rate he was not willing to declare AR PD at that time. Not that he may not declare 8 bit versions freeware or something, just that he had plans for AR online to be developed and a deal with Monolith: This pretty much meant he was contractually bound to protect his copyright. The Monolith thing went south but I am pretty sure he has not changed his position.

Online games are pretty big now, well over $100 million a year business. Kind of a shame he didn't get his going.

Certainly possible; unclear about the timing - goes back several years after OKC Springlake Vocational Technical School was renamed MetroTech.

RetroTech was my attempt at a clever play on the words as TACE once met in one of the other VoTech centers and utilized 20 year old computers. We were mostly *still* using them, although several of us recycled A8 items donated by those leaving the Atari fold. I just took possession of a box from Mike Berry with some original disks along with docs and miscellaneous books.

Surely whoever is close-by will make one and get it to you; where are you
located?

I know SIO2PC lets your A8 see the PC as a virtual disk drive, and I
understand that 1050-2-PC lets the PC access the real A8 drive... Does it
not allow you to format and transfer data from ATRs, etc?

Well, I guess it will work, because by default it uses the standard
SIO routine ($E459) of the Atari :-)

I was just too lazy to implement my own high-speed routine (and I
didn't have the source-code to one when I wrote MyPicoDos), and
just used the SIO commands $68 (get SIO length) and $69 (get SIO
routine) to load the SIO routine provided by the disk drive.
This works quite well with a Speedy 1050 and the HDI.
(I don't know which other drives / speeders support this command,
too).

So just try it, I don't have a MyIDE interface to test it by
myself. You can get it from:

http://www.horus.com/~hias/atari/

so long,

Hias

Howdy folks

I bought my second ST Mouse of my XE system on the last JHV of the ABBUC.
Since it had a funny colour, I put it in water with some sodiumcarbonat to
clean for a couple of days.

Guess what, the grease that lubricated the small wheels that touch the mouse
ball didn't like that.

Does anybody know what to use for grease.
The wheels and I guess the spindels are made of brass as far as I can see.
Will acid free vaseline (soft enough it seems for baby bottoms) do?

White silicon lube should be ideal, but if I remember rightly the roller axles are only push-fitted into plastic stays so as a general rule of thumb always lubricate plastic with neat washing-up liquid.

Must have been an old version of Speedy, cause the more recent ones don't
have that feature as far as I know.

CU Mathy van Nisselroy

PS I've seen Happy's with track displays. They were illegal copies and used
a red double digit 7 segment display where the power switch used to be. The
power on LED was replaced by a toggle switch. Unfortunately, the guy who
still has one, hasn't been able to reproduce them.

I'll recheck, but remember Atari mda at least 8 or 9 different ST mice. PC mice might even show a could of other variations. I have 2 ST mice and 1 PC mouse, all are different. Except for the ball and the thingy that keeps the ball from rolling over the floor. Parts interchangability is zero, nada , zilch.

With 'Washing up liquid' you mean the pure stuff, or added to water?

Our lawnmower sqreaches from time to time. Better not use to much. People start looking funny when the lawnmowers wheels are starting to foam.... :-))

I had an idea for rtdos going back at least 12 years or more (when I
first realized that A8 support started dwindling among the big
players, such as sega, activision, EA, etc.), but the name rtdos
itself is only recent by a few years. Actually it started out as
recycled technologies (i'm sure that's taken too somehow somewhere)
because of my interest in "OLD" systems but later shortened it to
retro tech. I actually thought about changing it to CTDOS for Classic
Technologies Device Operating System, but changing everything from
rtdos to ctdos would've been a pain (especially my numerous number of
email accounts).

Thanks Andreas, mo.

I guess only Fox-1's Atari tapes are stereo.

So, is it possible to preserve both data and music from these mono two-track (?) tapes?

Freddy.

I am not sure.

Here is what I know. Even standard IBM format 512 byte/sector disks can be read by a 1050 drive. The problem is a stock 1050 will only return the first 128 bytes of the sector and a modified drive will only return 256 bytes.

There are several ways of dealing with that. One is to just go ahead and use the IBM 512 byte sectors and only put data in the first 128/256 bytes. This required a separate program on the Atari to reconstruct the file. The other solution people took was to format the IBM floppies to 256 byte sectors and they can be read only by modified drives.

I would try just giving the program a command line file and see if it tries to write it out to a floppy, i.e. IBM360 MYFILE.TXT

I do not know that (ibm360.com) one, but here is another that I have used:
http://www.horus.com/~hias/atari/
Look for what he calls Atraidsk or maybe WriteAtr; they can write double
density (256 byte/sector) disks on the PC floppy drive which the Atari can
read. The .Zip includes instructions and the program is menu driven. Make
sure to format the disk on the PC with the program so timing hole is proper.

Yes. My BBS partitions (on SCSI harddisk with Blackbox) are close to 16MB (65500 sectors) and I back them up using A.P.E. 1.18D
running on an old 486SX connected to my local network. The actual ATR-file resides on another PC in the network.

Mono does also work. For the Atari it doesn't matter if the data is only on the left (right?) channel or on both channels. It uses
only one of them. Just check it out yourself. CSAVE a small BASIC-program to tape and play it on your stereo audio-tapedeck.
You'll notice it has only saved using one channel (forgot it's the left or the right one).

No... mine are stereo too.

I didn't read this whole thread, but I can remember I had in the past a very nice game "Atari (European) Countries and Capitals" or somtehing like that. It was a educational tape. When you loaded it there was MUSIC. That music was stored on the tape on a tape track, and the data on the other.

Btw. This game had a very stupid bug. It thought "THE HAGUE" was the capital of The Netherlands ;-)

btw2. It doesn't matter if the music is on the other track or on the SAME track. Once I tried to copy an ATARI tape with music and data by using a simple mic. After I copied that thing the data and music was on one track, and it still worked. Don't ask me why... i could imaging if the music was on the same freq. as the data beeps i shouldn't work....

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Howdy Andreas, folks

> DCM format is limited to 9999 double density
> sectors (each with 256 bytes). Whereas a harddisk partition can have up
> to 65.535 double density sectors (each with 256 bytes).

The source code to DiskComm 3.2 is available at the CSS site at
http://www.nleaudio.com/css under Source code for the BlackBox. Maybe
somebody can see if this can be changed.

>to write it out to a floppy, i.e. IBM360 MYFILE.TXT

If I remember, IBM360 is supposed to be run on the Atari. I believe you need a US doubler / Happy etc. drive modification and the disks must be single sided and formatted on the IBM.

Well,
I guess I found this (or a similar) program on an A8 disk, that
containded lots of converter programs. However the program IBM360.EXE
was not an Atari program. It was a program for the IBM-PC and could be
run under DOS. Hopefully this info helps... -Andreas.

Johnny,

Preserving the audio and data is exactly what I like to do too. This must be possible somehow, because the Atari gets the audio from the 'audio' pin on the SIO bus and the data from 'data in'. So I guess sampling to WAV and WAV2CAS won't work in these cases.

In the A8 faq subject 'program recorders' I read "Track configuration: 4 track, 2 channel (digital data and audio track)". So, what does this mean??

Maybe the CAS format should be updated so that it can hold the digital data (current CAS) plus the audio (WAV?). Ernest, what do you think? :)

Freddy.

I have gotten some to work with 800XLDJ which emulates an Atari
disk drive. I use my Hades as my Atari 8-bit drive and have it
connected my to 130XE using a SIO2ST(PC) cable.

6025. Elektraglide on .ATR

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-06 15:47:50 UTC
From: dunxuk@aol.com
Message-ID: <20021106104750.25479.00000064@mb-ch.aol.com>
Source record: 26443

Can anyone point me to an ATR or DCM image of Elektraglide that has no copy protection on it (i.e. it will run when transferred onto a 5.25" floppy).

The file on Aaron's site searches for a bad sector on the disk when you reach the fork in the road at the end of the second sector and stops.

TIA,

Dunx

Hello All,

Just a quick reminder that my two Atari 8-bit PC CD-ROMs of Atari commercial software are still available to buy. For full info, and to buy via PayPal with a credit card, please visit http://www.dgs.clara.net

Recently, I launched a new way of buying commercial products from us. 'Products by e-mail' allows you to buy commercial Atari 8-bit products from us at minimal cost. Instead of a physical shipment, the products you choose will be e-mailed to you as a ZIP file containing both ATR and DCM versions of the disk, along with a manual in text format (or PDF if the file is small enough). You can order on-line using your credit card (using PayPal). This now allows you to order products at a much reduced cost, and to have them within 24 hours (usually less).

At present, only a few of our products are available on this service, but more are to be added soon.

Prices start at just US$2.

Please visit the website at http://www.dgs.clara.net and click the 'products by e-mail' button.

Dean Garraghty

> not sure. haven't really tried it but once or twice on Antic disks.
> Anyone else ?

The version of Xformer transformer I tried does not get past the
intro/create character screen with The City. I don't know how The Dungeon
works on it. I never tried Atari800WIN after I had trouble getting sound: It
seems to be the more advanced of the two.

I haven't played it lately. When I used to play it I was using SIO2PC with a
real Atari. I would boot the copy protected disk from a real drive and use
the .ATR for the game disks/swapping. Later I moved to using a cracked
version w/o a real drive.

Hi Freddy, and you all

My experience with preserving tapes from various 8-bit systems tells me that the most "exact" tools are the ones for the Sinclair Spectrum tapes. Neither the wav2cas for the MSX, the voc2tzx for Amstrad, nor wavprg/TAP utilities for C64 work as good as Taper/Maketzx; these allow you to make a TZX for each block of the tape programs, and show if each block is correct or not. Eventhough they are near perfect tools, they can't convert the tapes which have music after the header block -and there're some games like this (i.e., the spanish versions of "Tank" and "Regata"). It's supposed that the problem for the Spectrum tapes is that the program expects the audio blocks, which works as a kind of protection, so you have to hack the game if you want it to work -and, at the end, it's not an *exact* image of the tape, but a hacked one.
With this story I mean to say that converting the tapes that mix audio and data in a file that preserves it and can be even used with an emulator is difficult if the file is not a wav. (My english is not very good, I don't know if what I want to say is clear).
So what I'm going to do is to sample my Atari tapes as wavs, at least until anybody creates a tool to make an exact copy of these. I'll be tunned... ;-D

Thank you all for the info...

Regards

jaime, aka johnny farragut

I expect it would require _two_ WAVs to preserve those tapes (audio + data).

For 'data only' tapes the WAV2CAS from Ernest Schreurs is useful. A CAS file
is much smaller and holds the same information as the WAV (I've been told).
The WAV can be deleted after the translation.

Freddy.

Hi,

in the 1980ties there were two versions of speedy (from compy shop),
one whith and one without digital track display. The one without could
be upgraded with a display.

I think around 1986 came the so called "Mini-Speedy". The Mini-Speedy
is smaller without the hooks for the track display. Since then, almost
all speedys have been Mini-Speedys without the display.

Carsten

BTW, thank you (Mathy) for the text to the JHV pics

6033. SIO2PC PCB

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-06 22:27:23 UTC
From: llppwhite@aol.comnsp
Message-ID: <20021106172723.05942.00000108@mb-bd.aol.com>

Has anyone else seen these on eBay? From the pictures, it looks like a very nice implementation, including a jumper to select the RI or DSR lines. I had never seen an SIO2PC PCB before. My "creations" work well, but I've got to admit that aesthetically they look pretty lame compared to these. Of course, once the box lid is closed, mine looks fine. :-) What are the quantities required and costs of small-run PCB's?
Larry

Since you asked, I will post what I think. I was going to do that
anyway, but I was first doing some research.

First off, let me set some facts straight:

On Mon, 04 Nov 2002 20:25:55 +0100, Andreas Magenheimer
<magea000@students.uni-mainz.de> wrote:

>Nope,
>there were many tapes by Quelle-soft and Europa (both german companies)
>which used sound during data playback. But I insist: the tapes are mono

>playback a tape with data and music on my hifi-system, the right channel
>is still noise only (it is unused!), whereas the left channel contains
>both data and sound !! -Andreas.

The fact that some audio equipment plays back some tapes mono does not
mean that the specifications are all of a sudden changed. If
Quelle-soft ignored the rules, that does not make the Atari tape units
mono. I could not find the service documentation for the 410, but the
book De Re-Atari was published by APX, thus by Atari. Appendix C
clearly states "Tapes are recorded in 1/4 track stereo format".
http://www.atariarchives.org/dere/chaptC.php

Your story about half left track does not make any sense. Maybe the
fact that they mention 1/4 track made you think about half tracks. To
a mono player, a stereo track could be interpreted als two halves that
are processed as one. Since the tape can be turned around, there are
two sides, so each stereo track occupies about 1/4 of the tape. Since
most Atari tapes only contain data, the data track on one side of the
cassette occupies 1/4 of the tape. But there is no such thing as a
half stereo track. A stereo tape head has two gaps and coils for
detecting magnetic signals, each one reading one track.

And to set another thing straight, I was not clear in my wav2cas
documentation, but as the book De Re-Atari clearly shows with a nice
picture, the data portion is indeed in the right hand channel, not the
left hand channel. Playing back a tape that also has an audio channel
on some audio equipment does seem to mix the data with the audio.
Maybe because the headphone set mixes the tracks, or because the audio

player has bad channel separation, or because it needs head alignment. Maybe the cables are just connected wrong. Again, this does not prove anything, the specs are clear and true. My audio player works fine and confirms the Atari specifications. Quelle-soft tapes probably conform to these rules too.

Now that the facts are straight, on to my opnion. The .cas format is designed such that it can be expanded. One could design some new record type, like "wave". My specifications clearly state that unsupported (and new) record formats should be gracefully ignored by skipping that unsupported data. So if we can all agree on some new addition, and the authors of the emulators are willing to add support for it, there should be no problem doing this. Well, only the problem of how to solve this. I listened to my tapes for "conversational Spanish/Italian/French/German" and they all contain audio tracks. You could sample them, and include the sections of speech as wave records. But that would still not work. The digital track has markers that are used for synchronizing with the audio track. They are not data but the marker tone can be detected by looking at the SIO pin directly. Since it is a continuous tone, it cannot be expressed as bytes, but it could be used to measure the length of the audio portion. Or it could be made another record type, "mark" for marker signal or something like that. On the other hand, some tapes simply have audio without it being timed by the program. The Atari Speed Reading cassettes have an audio introduction that tells the user something while the program loads. Some games play music while loading.

All this would be possible, but would a lot of people really like to have this? Is it worth the time and effort? There are a lot of training CD's for the PC nowadays, so these old tapes are not needed for training anymore. Of course it would be nice to preserve these tapes properly, but it would take quite some time. Letting a marker control the SIO register in an emulator might not be easy. I think the people that wrote the emulators would have the biggest vote in this. Maybe we should just simply save the audio as real .wav files and then the emulator could simply play back the file. We could add a reference to the filename in the .cas format. There are lots of options.

Keep those 400/800's buzzing.
Ernest.

I don't currently have a copy of Xformer. Last one I had I seem to recall running it on 486SX if that gives you some idea of how long ago and the probable version.

The Atari800WIN was much later but it was before I got into 3D PC games so I wasn't familiar or up to date on DirectX. It is probably the best choice now and would have been if I had been more up to date.
>
> what about 1050-2-PC ?

As far as I know none of the emulators support it or
ProSys cables. I think the Xformer printer to 1050 cable worked with Xformer but was kind of limited. It relied on timing loops so changing the processor speed would ruin you.

Just my opinion; if the emulator programmers have any juice left they probably should get a version running with one of these cables and their own copy protection back up scheme.

I tried w/o success to get Derek interested. The bright side is Steve Tucker was interested enough to do the ProSys and the concept proved feasible. Lot's of things with copy protection are so
timing sensitive that an emulator may have trouble with them.

Ok, so the "4 track, 2 channel" actually means: side A has two channels to record on (left and right) and side B has also 2 channels to record on (again, left and right). Personally I find this very confusing. I would just say; you can record stereo on both sides of the tape. :)

Great! So, we _can_ record both channels and preserve the whole in a stereo WAV?

If a stereo WAV preserves everything, I'm happy with it. I'm sure somebody will add emulator support for some kind of special format, but in the meantime we have to preserve those tapes!! :-)

> Keep those 400/800's buzzing.

Matthias, Stefan and myself are working on a new disk image format to store
copy protected disks.
We plan to have support for this format in the tools Matthias works on
(sio2pc, 1050-2-pc). Since the format is documented and the tools will be
open source, others should be able to add support for it.

Freddy.

Yes, I have seen these and have even bid on one of them.. Never thought the bidding would go as high as it did. Unbelievable. I still like using mine I won bidding on Ebay by the guy in Poland. As for the small-run of PCB's, I have no idea for quantities and cost.

Happy Ver 6 or 7 did include a .COM file utility for the Atari which could
read/write an IBM SSDD 180K MS Dos disk using a Happy modified 1050 and
transfer data files; it did not function on the U.S. Doubled models...

Do all 256 sector disk formats have 128 bytes only in the first three
sectors?

What about large partitions, 16 MB for instance?

Thanks,
Shawn

I'm thinking that it's time for some smart person to develop a cartridge that has slots for flash ram cards. Whether "memory stick" or whatever, I'm thinking that just about every Atari 8-bit application and game could fit on just a few 512 meggers.

Any ideas?

After some confusion, I must agree. I thought he was talking about PCXfer
which has this text posted here.

http://groups.google.com/groups?hl=en&lr=&ie=UTF-8&th=e404baefb3b65aff&rnum=1

That program is here along with that text included

http://www.umich.edu/~archive/atari/8bit/Diskutils/Transfer/pcxfer.arc

But a search for ibm 360 turns up a holmes's link to this
Toms MSDos 2 Atari-Ibm360
http://209.4.22.21/atari/atr/apps/Toms%20MSDos%202%20Atari-Ibm360.zip

I don't even know if any of those links will work, %20 stands for a space,
and always watch for word wrap. I do know that the floppy will HAVE to be
formatted on the PC in order for the PC to read it with any success at all.

format b: /1/4

Used to do it for me back in the Happy Utility transfer days. But as soon
as I saw Ataridsk, I've never looked back, hands down the best way short
of a SIO2PC cable.

I don't think any PC formats are like that, but I don't know for sure.
On the Atari, they are _supposed_ to but how can one really tell?
I suspect that the 1050 does some 'emulation' too - see below.
Again, I don't know for sure.

>
> What about large partitions, 16 MB for instance?
Nope, you can start a partition on the Black Box at any sector you want,
and that would then be a 512 byte sector which the Black Box emulates to
a 128 byte sector and the next two sectors as well. An Atari sector
editor will say 128 bytes, but a PC one will say 512. Then on higher
sectors the Black Box emulates two 256 byte sectors from one 'real'
512 byte one. So there is a difference between a 'real' sector, and
what the BB will say is a sector.

The Floppy controller in the 1050 is certainly capable of slapping down
what ever size sector you can program it to. But the rub is, does it
really do three 128 byte sectors on a standard DD format as in MyDOS?
That _is_ the standard, but you can't boot a DD disk in a standard 1050
anyway, so why go out of your way to hold to the standard? I'm not
sure if there is an easy way to find out either way.

It has been a while since I last looked. There were a fair number of places
that do small run PC board, some even supply you with their proprietary
software for laying the board out.

Most of the boards work out to a minimum charge of ~$50-$100 for 1-3 boards.
Just as I stopped soldering there were some former Iron Curtain countries
that were doing prototyping and had a very good reputation for quality and
turn around. I think there was one located in Romania that had a fixed
charge of >$100 for something about 1 sqft. IIRC, they actually recomended
you put 24 2"X3" boards designs on that size to reduce your costs per board.

http://www.cadsoftusa.com/Boardhouses/

Seems to have a good list.

Well,
on an Audio-CD (like my hifi-CD-Recorder) it is possible ! And if you
then use the polish CD-ROM interface, you can load that CD into your
Atari computer. But I do not know how to do it in any image-form (as an
ATR, XFD, DCM, ... image) - I think it is not possible... maybe MP3 or
SAP or WAV can do it, but images ?!? Maybe someone can enhance the CAS
format for this purpose. -Andreas.

Well,
the tape recorder is stereo and 4 track, but it uses only mono (1 track
or 1/4 of the two stereo channels) to store the data... Besides, when
the Tape program was multi-stage, the music always stopped/was
interrupted when the "big" beep for the next part sounded through the
(tv) speaker. As soon as the next part began to load, the music
continued... -Andreas.

6050. Re: Converting to .cas (was: Re: Atari 1010 cassette player)

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-07 19:31:22 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DCABF8A.DA690A40@students.uni-mainz.de>
Source record: 26124

Well,
the little Atari completely ignores the music on any tape - so it cannot be used as a copy protection here. And as I said before: On the tapes I had (Quelle+europa) both data +music were on one channel, which means the data uses only half of this one channel and the music uses the other half. Thus one WAV file (or MP3 or maybe SAP or something else) would be enough - for the human ear this sounds quite strange (you hear data beeps and music as long as the program did not use Poke 65,0), but the atari can use this, because the data is digital, whereas the music is only analog and completely ignored by the A8. Do the following: hold down Start+Option on your Atari and wait until the selftest appears - now you can press play on the tape recorder and listen to a music-tape. (There are other and better tricks of course - you can use a small program which starts the motor of the tape recorder to playback any music you like and then still load programs from disk; the GUI Diamond GOS has a utility for this case!) -Andreas.

Well,
of course the specification of the tape recorder is stereo - but it does
not use stereo - it uses mono. Lets imagine you have a stereo
hifi-system, you can record music on two channels, thats stereo (or in
some unusual cases mono on two channels), but if you record music only
on one channel, then its mono, allthough your hifi system is stereo...
Sorry for the confusion. -Andreas.

6053. Re: Disk format question

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-07 19:47:41 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DCAC35D.3DD33C70@students.uni-mainz.de>
Source record: 26127

Well,
this can get a little confusing too. If we look at the disk or the diskdrive (harddiskdrive) then they have 256 bytes in every sector, because the whole disk or the whole harddisk partition can only be formatted in one format (128 or 256 bytes for the whole disk/harddisk part.). If we look at the Atari getting data from that drive, then it is only 128 bytes, because the Atari OS is limited to 128 bytes for the bootsectors. This means, that the drive physically has 256 bytes, but it only sends 128 bytes (of the bootsectors) to the Atari. If it would send full 256 bytes, the Atari would respond with a boot error (this happens with XFormer and thats why none of the Xformer disks in DD are bootable on the Atari)... -Andreas.

Larry, I did a "Buy Now" on eBay on that "Atari 400/800/XL SIO2PC
cable circuit board!" I have built several of Nick Kennedy's SIO2PC
devices, of which none of them look as streamline as this 1.5"x1.5"
PCB. It works great with either Nick's software or Steve Tucker's
APE. I thought the same thing about having these boards reproduced,
but I do not know if that would be an infringement on a copyright or
not. If somebody knows let me in on it. The component layout for the
most part is in line with SIO2PC, other than the addition of a green
LED, which lights up on correct connections and the RI/DSR jumper
(which is nice). Its a nice mod, just do a "Buy Now" on eBay when you
see it next. Its something to see up close.

I've heard some interesting news on the JHV of the ABBUC (Yearly members meeting of the Atari Bit Byter User Club) in Germany two weeks ago. Some of these cards also work in IDE mode, so that's no problem. And somebody was considering looking into some kind of card (don't remember the name, it was a square looking memory thingie), but there were personal reasons why this could take some time.

Howdy folks

Does anybody know of a version of WinZip that will run under Windows 95?
UnZIP by Tom Hunt (of the 8 bit Atari) is a wee bit slow on bigger files
(like demo's that need extended memory). It is nice though for smaller
files.

Hello,

I'm looking for a complete list of all DOS XIO (CIO special) commands,
in order to build up a reference for DOS developers to prevent that
each new DOS comes with an incompatible set of XIO commands.

I found an inclomplete list at some places in the net, you'll find the
information I collected so far in
http://www.strotmann.de/twiki/bin/view/APG/PgmXIOCmd

But I need your help to cover all DOS Versions (at least all that are
in use today), especially

* MyDOS
* Turbo-DOS
* Bibo-Dos
* Bewe-DOS
* other DOS Versions in use

Please post here if you have information for me or enter the
information directly into the mentioned page
http://www.strotmann.de/twiki/bin/view/APG/PgmXIOCmd

Thank you,

have a good weekend!

Carsten

With 4Kb of RAM, not many people were considering it :) I am also an Atarian, and voted for it, but now that I think about it from the perspective, I'd rather have C64.

I can't say what is in the physical sectors, but any disk that is capable of booting on the A8 must behave like it has 128 bytes in those 1st three. I suspect that some form of emulation occurs to that effect in the disk controller or elsewhere in the drive system.

The computer initialization process includes a check of the cartridge slot for authority to poll for drives and an attempt to boot the disk using the resident disk handler. This RDH is hardcoded in the ROM OS and always tries to read a 128 byte sector one from drive one using SIO; it then looks in the sector one contents for a quantity of 128 byte sectors to load and at which address to place them. The code in those sectors is executed after loading is complete. Apparently the A8 double density developer determined that three sectors was the proper and most efficient number of 128 byte sectors to configure SIO to continue the boot process with 256 byte sectors.

Me to that year.

The Atari was some 300-500 at the time. Sensible money was on the BBC micro like they had at school (300 again) but i had less than 200 to spend. It was at the time a toss up between an Oric 48k or a Spectrum 48k (the commodore 64 hadn't really yet arrived in the shops round here).

The Aquarius seemed out of place when it arrived, kinda like 2 years too late. It was competetive with Acorn Atoms, Vic 20's and the ZX-81's of 1981-82. But by 83, RAM was the selling point, next came games, and price pretty much dictated what one you bought. if you had about 150, it was a speccy, The C=64 was about 230, If you had 300+ a BBC or an Atari, but because BBC's were in all schools, The Atari came about 4th down on the list if it was your parents money!

Still wanted an Atari though, because of star raiders.

Sorry guys, I've still not read a clear answer here. E.g. what is a channel and what is a track? I guess a channel is just the left or right from the stereo signal and a track is the space on the tape where you can record a (two channel?) signal.

Then the 4-tracks. Two tracks on each side. So, you could record data on the right channel of one track and music on the right channel of the second track?

I'm not an expert, but I don't think the audio tapes hold both digital and analog signals. When music and data is on the same channel (and the same track) and you would sample this into a WAV, you would need some DSP technique to separate the data from the music (if such thing is possible).

In other words, I'm not convinced that one-signal WAV files are good for music + data preservation.

Freddy.

"Andreas Magenheimer" <magea000@students.uni-mainz.de> wrote in message news:3DCABF8A.DA690A40@students.uni-mainz.de...
Well,
the little Atari completely ignores the music on any tape - so it cannot be used as a copy protection here. And as I said before: On the tapes I had (Quelle+europa) both data +music were on one channel, which means the data uses only half of this one channel and the music uses the other half. Thus one WAV file (or MP3 or maybe SAP or something else) would be enough - for the human ear this sounds quite strange (you hear data beeps and music as long as the program did not use Poke 65,0), but the atari can use this, because the data is digital, whereas the music is only analog and completely ignored by the A8. Do the following: hold down Start+Option on your Atari and wait until the selftest appears - now you can press play on the tape recorder and listen to a music-tape. (There are other and better tricks of course - you can use a small program which starts the motor of the tape recorder to playback any music you like and then still load programs from disk; the GUI Diamond GOS has a utility for this case!) -Andreas.

The problem with something like this is the driver required to run such a device. You have to have code in some location to "talk" to the card and do data transfer. The hardware is simple as is the code itself - where it sits is not so simple.

6078. Re: Looking for/Working on a complete DOS XIO command refernce

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-09 00:01:21 UTC
From: s.dorndorf@gmx.de
Message-ID: <c0fae91c.0211081601.36faa1fb@posting.google.com>
Source record: 26048

Hi Carsten,

long time ago, I had examined all important DOS versions, here are the
results:
(I ignored SpartaDOS and BiboDOS, because these DOS versions use the
RAM under the OS and therefore don't work with TurboBasic, a very big
disadvantage!)
Empty positions mean "same as ATARI-DOS 2.5"

XIO ATARI-DOS 2.5 MyDOS BeweDOS TurboDOS XDOS
---
32 Rename file
33 Delete file Del file/dir
34 --- Make Dir Clear disk Get dens.
35 Lock file
36 Unlock file
37 Point position
38 Note position
39 --- Load file Get length Exec. cmd
40 --- Load file Load file Load file
41 --- Change Dir
42 --- Make Dir Make Dir
43 --- Delete Dir
44 --- Change Dir
47 --- Get Diskinfo
251 --- Format QD
252 --- Format QD Format DD
253 Format SD --- --- Format DD Format SD
254 Format MD(SD) Format --- Format MD Format MD
255 --- Format SD Clear disk

XIO 254 under DOS 2.5 tries to format MD and if the drive doesn't
support MD, it formats in SD, other DOS-Versions try only to format
MD.
XIO 254 under MyDos works as following:
If AUX1, Bit 7 is set, the disk is only cleared (empty directory
written to disk). If AUX1 Bit 6-0 and AUX 2 are zero, the formatted
disk will have the current density setting of the drive, if not,
AUX1&AUX2 define the number of available sectors.
BeweDOS has no format commands in the FMS. The note and point commands
deliver a relative file position rather than an absolute sector/byte
position as the other DOS versions do.
You can use XIO 33 to delete (empty) MYDOS-directories. MyDOS allows
to ignore INIT- and RUN-addresses (in XIO39/40) by setting an
appropriate AUX1-value (4=do Run & Init, 5=Run only, 6=Init only,

7=ignore Run and Init).
In XDOS this is possible via XIO 39, e.g. XIO 39,#1,0,0,"D1:LOA file"
XDOS allows the execution of every DUP command (DIR, LOA, SAV,
COP,...) via XIO 39 and the density of a disk can be checked via XIO
34.

I haven't included the lower XIO command codes (4,6,8,9,12), if you
need more details, please post an additional message.

Stefan

Yes! I have all 3 of these, and you are absolutely right. Don't forget the
Atari Screen Editor -- best of the three, although the C64 is a close second.
It's too bad that Atari didn't look far enough forward to include an 80 column
mode in Antic. It will also be interesting to see how the Commodore One
develops (1983 meets 2003?)

In that year I was 7 years old. One year later My mom was the winner of a contest "Make your own Christmas card" and won an atari 800XL. That was BRANDNEW in the Netherlands, and the only thing coming with this computer was Ms.Pacman cartridge hehe.

When I got a 1010 program recorder I was really happy. Only in 1990 (!!!) I bought my first 1050... now the atari hardware-stack is higher than the house here :-)

Marius

btw. the C=64 was more promoted in the Netherlands, so I was the only child in primary school with the atari 800xl, but that didn't matter to me. In high school there were more atarians. I think the nice part of the C=64 is the sound chip. Really cool sound. But for the rest I still prefer my atari 8bit.

Btw. I had an Apple 2c too. It was (is) an incredible powerfull machine ...
and it is definately a good one for serious programms like Apple Works and
Apple Paint. I loved it, but the atari won :)

Well I've always loved my Atari 800 - but I chose the C64 because I actually did consider it in 1983. The television and magazine ads made its color look alot richer than the ataris. Little did I know the tricks they were using when finishing those pictures. I now have all of the above computers (except aquarius) and I dare say even today it's hard to say which one is better.

>
> Then the 4-tracks. Two tracks on each side. So, you could record data on the
> right channel of one track and music on the right channel of the second
> track?

Actually, it is very simple:

A standard compact cassette holds 4 tracks. Two tracks are used for each
side, and - for music - one track is used for the left channel, and
the other track for the right channel.

In case of the Atari 1010, the left right channel holds the digital
data, and the left channel holds the audio signal.

The digital data is stored using two different frequencies,
3995Hz for "0" and 5327Hz for "1".

If you play back a tape with both digital data and audio on your
stereo equipment, you should hear the digital "briii-brii-..."
in your right loudspeaker, and the audio in your left loudspeaker.
If it is kind of mixed or so, either the tape was recorded with
a misaligned tape-head, or the head of your stereo cassette
player is misaligned.

So, what's happening when you play back a tape on the 1010?

The 1010 has a stereo tape head (so it can separately handle
digital data and audio at the same time). The audio channel is
simply sent to the audio pin of the SIO connector, without any
further processing (ok, except amplification and other stuff every
normal cassette player would also do).

The "digital" data is routed through an electronic circuit that can
detect the two frequencies (3995 and 5327Hz), of course with some
tolerance so it can cope with slightly varying tape speeds.
Depending on which frequency it detected, either a "1" or a "0"
bit is output to the SIO data-in pin. All further processing (like
assembling the bits into bytes, detecting start/stop bits etc. is
done by the POKEY in the Atari).

What happens if you record something to a tape in the 1010?

The Atari (i.e.: the POKEY) just transmits "0" and "1" bits to the SIO-data-out pin, and then the 1010 either generates a 3995Hz or a 5327Hz tone and records it on both channels (IIRC) of the tape.

So, to sum it up: Assuming that you don't have a misaligned tape and/or stereo cassette player, it should be possible to just connect your stereo cassette player to a stereo soundcard and store the tape as a stereo WAV file.

BTW: A good description of the Atari cassette formats can be found in "De Re Atari", appendix C, eg available online at

http://www.atariarchives.org/dere/chaptC.php

so long,

Hias

#5 should be string length error, so probably not really what is
happening...

If ASPI loads at $8000, then it does not sound like it is auto-locating
itself into highest memory available... do you remember how the memory map
for Turbo configures? Where is Memtop with ASPI and your program loaded?
What does FRE(0) tell you?

Have you looked at the ASPI code? Does it extend completely to $8800? Do we
know if it reserves any RAM as working space? We might .ORG our code at
$8800, BLOAD it into RAM and call it with OFFSET =
USR(34816,ADR(DIREC$),START)

Hi Carsten,

here the commands I found in the OS/A+ manual:

ICCOM Type of command
3 open
4 read
5 get text record
7 get binary record
8 write
9 put text record
11 put binary record
12 close
13 dynamic status
32 rename
33 erase
35 protect
36 unprotect
37 point
38 note

Regards
Frank

Jindrosh *has* put together a great reference there, but that is SIO. The
XIO commands actually correspond to the CIO routines which are a higher
level and merely use SIO to accomplish the necessary functions.

In 1983 I had a HP 41CV, my first computer.
Christmas 1983, I got money from my parents to buy
a computer. I got 3 Coleco Adams, all three were
DOA. My son said 'Get an Atari'. So, $300 for
an 800xl, $300 for a 1027, $80 for a 1010, $80
for Atariwriter, and $325 a few months later for
a Rana 1000 and I was into Atari 8-bits.
I couldn't remember when I got the first Atari.
I did remember my first program entry was 'Crash
Dive' by Brian Moriarty from issue 18, April 1984
ANALOG. I couldn't figure how a bunch of DATA
statements could be a program (ml programs in
ANALOG you entered with DATA statements
and then wrote to tape or disk the ml program.)
Soon I had a MPP 1000e 300 baud modem and
a BBS (Mat Pritchard's AMIS MPP.)
My first DOS was SmartDOS, by the RANA people.
I used that DOS for dbl density many years until
SpartaDOS 3.2d.
Uhm. I ramble. But I can say what I would do in
1983, because that's what I did.

You guys know it's possible to play sega genesis and mame arcade games on the internet with the kaillera client? It would be so nice to have the Atari 800 Win Plus 3.0 working with kaillera for some MULE multiplay.

6099. Atari 130XE, would like to recover whatever I can from my old floppies

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-10 02:30:18 UTC
From: piclistguy@yahoo.com
Message-ID: <97d41df6.0211091830.33f90fa4@posting.google.com>
Source record: 26070
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

I received an Atari 130XE as a gift in 1986. It was my first computer.
It has a nostalgic value to me. I miss all of those games on my
collection of floppy disks. I would like to see again some of the many
programs I created in basic. However, it is now 2002 and I haven't
touched the 130XE in over 10 years and its at my parents home
thousands of miles away. At this point, all I can hope for is to
salvage some of the data on my floppies. I don't worry at all about
the hardware, since if my 130XE doesnt work anymore, I could try to
have it repaired or buy an old one from ebay.
But my data is something that can't be replaced.
Is their any way I can recover the data on my old floppies?
I don't want to setup my old computer to salvage the data. I am
concerned that the 130XE disk drive could potentially damage the
disks, since the drive itself is quite old. Ideally I would like to
find a way to use a PC with a 5-1/4" disk drive that can read an atari
diskette and write the exact bit pattern to a brand new 5-1/4" disk.
Even better if there is some utility that can perform some type of
error correction on corrupt sectors. Or perhaps there is some service
center that specialized in what I need done.
Please explain what I options I have to recover my old data.
Thanks

Just doing my semi-monthly rounds of the Atari sites when the sight at Holmes hit me like a slap in the face.

http://homepages.paradise.net.nz/atari/

"Piracy: This Game is Over"

I'm having a hard time imagining any of the copyright holders of these twenty year old games being so rabid as to shut down a site like Holmes.

Does anyone know the story?
Does "Holmes" follow this group? If so, perhaps we could find out what went on.

In any case, it was a great resource for people who were looking to re-live some old memories and didn't want to get heavily involved in the binary newsgroups.

I'll miss ya, buddy.

If you want, I have a decent drive setup which is attached to my PC via an SIO2PC cable. I can copy your disks into ATR files for use in an emulator, or just dump them to TXT files for you to look at on your PC. All I'd charge is the actual disk media itself to recycle for my own use. The drive I use has very little millage on it so I don't think there would be any problems there, although your disks are 10+ years old and may or may not be readable (I'm sure they are though). Let me know,
Mo

Atari is owned by Infogrames. Hasbro sold their "Hasbro Interactive"
group to them a while back.

This is not what I know about that ;-)

1) Atari doesn't send the data in format 0/1 but audio. FSK is only
DECODER.
2) Write head has only one track connected.

ACK. You are definitely right.

> 2) Write head has only one track connected.

OK, I'll trust you :-) It's been some 10 or 15 years since I last
used my 1010 (and since I looked into the schematic which I seem
to have lost by now...), so it's very likely that I mixed something up.

Thanks for the correction!

so long,

Hias

there are owners of these programs who visit this newsgroup regularly
to see what is up on there old favorite machines.
they still own the copyrights to there programs, and some of them have
gone the corporate route and have to answer to shareholders.
many here will not believe this, but i have been in contact with many.
some do not care, others must act on piracy they have no choice.
i know that the programs are 20 years old, but to a programmer who is
still active, who's product might be owned by a corporation they have a
legitimate gripe and are forced to act.
the only thing that i can say is to search the net for these programs,
many have been released in some shape or form for the public, and maybe
someone can pain stakingly put together a site with just this type of
programs.
holms site was a valuable museum for atari8's simply because this stuff
is disappearing very fast.
thanks,
lance

6114. Supercart images

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-10 20:00:58 UTC
From: Technoid Mutant <None@nowhere.com>
Message-ID: <2fetsuku5d2gl4sd7fbl2pbht9ikdet3cv@4ax.com>
Source record: 26085

I've been disapointed with the Atari PC emulators til' last night when I tripped over Atari800Win version 3.0. WOW. Sounds work perfectly! Today, knowing it wouldn't work, I specified SpartadosX 4.22 as a cart image for the emulator and LOW and BEHOLD. SDX rom images work as well! So I tried it with Pocket Atari on my Ipaq and it worked there TOO!!!

WOw is all I can say. WOW.

Now to the point of this message. I can't find any BasicXL and Basic XE rom images. I own several of each cart but don't have the means of dumping thier contents. Besides, all the carts are flaky as heck. I must have gotten a bad batch of roms that fuzzed out early.

Does anyone know where to get rom images for:

BasicXL
BasicXE
ACTION!
Mac/65

Thanks in advance,

Jeffrey S. Worley (Technoid Mutant of Cheez Daddy's House of Funk BBS)

Tom Hunt Created a Spartados modification which had memlo WAY below
ordinary. All commands were external and it had a true 'Path'
environment variable ala SpartadosX and MSDos. Might want to get in
on it. It worked well. I still have my copy but he enjoined me never
to distribute it. Amazingly it has been night on a decade now and I
haven't.

He called it SRP dos. It is sparta with all commands as extrinsic.

Regards,

Jeff

I have not toyed with that language, but it is probably a binary load and go
.exe file; press "A", Return, Return to see what is on the disk. Hopefully
the file names may provide clues from titles and/or extenders. Could expect
to see some form of Editor or similar you can execute with "L", Return,
"NAME.COM", Return. You may even see a .txt or .doc file which you can copy
to the screen and toggle the display with Ctrl-1; use "C", Return,
"FILE.EXT, E:", Return.

When you find the executable, you can rename it to AUTORUN.SYS on a backup
duplicate disk so it will auto start during system boot.

Body handling: HTML body converted to readable text

Not certain what you are reporting there... with no cart, the 800 should
boot to Memo Pad.

If it is giving an erratic display, you might clean contacts and reseat all
chips and daughter boards. You may also have a bad memory chip in the screen
RAM area.

Only a really old PC with archaic disk controller would be able to read the
single density FM coded Atari 5.25 floppies. Even the 1050 non-standard MFM
enhanced density does not seem compatible with PC floppy controllers.

Building an SIO2PC cable involves using your XE and drive for the transfers
as does use of a null modem cable. BTW the A8 drives use a crc type checksum
when reading the sectors.

When you remove your hardware from the picture, you only leave 3rd party
hardware. I am unaware of any commercial providers of transfer service; just
a few afficionados like Mo and myself who have done it for other former
Atarians.

Hi Sanjay,

If you do pick up a used 130XE and drive, you could probably test it out one some blanks or duplicates of stuff. Or you could also pick up a drive from one of the remaining mail order dealers, theres a few around. That way you could get yourself a drive that works reliably to recover your old stuff. Believe it or not I got a couple well used 1050's and 810's that I've managed to kept in good order. Wasnt too hard either.

I can see what you mean bout not bothering with the one you left in your parents house. If its in another country the shipping would be expensive and it would probably be a different video standard and perhaps require different power supplies as well.

Me too. Holme is anything but a pirate. His work breathes life into these creations that would otherwise disappear forever. I understand there may be some corporate entity or perhaps even an author who might be against it, but Holme gives these people the opportunity to speak up and say "take my property down."

It makes me so mad when a hardworking archivist like Holme is criticized. He is not stealing this software; he is *saving* it!

Sorry guys, It appears I've caused a bit more of a stir than I though I would with the 'ancient' Atari advert I put online for 24 hours. I've been scanning anything to do with Atari in my old collection of BYTE mags, and I'd never seen that advert before. And for some reason, really liked it! :-)

It also fitted in with my plans... I know I've talked about closing the site down before, but this time I'm for real. Come 31st Dec, the Atari games part of my website will finally close after a good 5 years. So if you are after anything, now's a good time to get it. :-) I am thinking about running one last competition so that the winner(s) can get a copy of my entire collection on cdrom(or how ever many it is now!), but so far I am lacking an idea for this competition.

I've had a few offers in the past, to take over my website for me, but in all cases, the people have found, that like me, time is very scarce, thus nothing ever got off the ground. So I dont want any offers for that.

Anyway, there's still great Atari Game Resources out there, like Homesoft, and Vietnam Atari websites to name but two. And they both update much more frequently than I ever did.

I'll be still around to 'dump' various games or personal disks for those who cant or dont want to do so themselves. Just ask.

I will be taking some time to try to thank many of the contributors of the site soon.

Cheers

Yep, everything is still available for download until 31st Dec, at which
time I'll be replacing the website with something different.
Please grab what you can, while you can. :-) There are a few broken links,
or wrong games linked there.

Thanks to everyone who has emailed games in over the years, and for all
other contributors to my site.

I've also had many programmers contact me over the years, many of whom, liked the fact that their games were still being played. Only one programmer asked me to remove his games. Of course I respected this and they were removed. (although he never gave me a specific list of games, so I may have missed one or two.)

> holms site was a valuable museum for atari8's simply because this stuff

That would be a great idea, if someone can set up a FTP site, and is sure it will be permanant, I am happy to transfer the entire archive to it. Then everyone will still have access to it all. I must stress though, it must be a permanant 'online' 24/7 ftp site. And it must be fast.

That would be great.

You also seem to have two 8E banks listed, a pair of wires
both needing to be swapped? Try some different testing
programs, you might get different results.

Yeah, I thought about that part of it _after_ I posted too. But most
XIO commands out of the ordinary are going to be the 'special' type
which are handled by SIO, so some of what's there can still be used.

I didn't realise that the different DOSes had such different handling
of the various XIO functions, always nice to learn something new.

You are right. Those first three sectors MUST be in single density.
Percom is the company that developed the standard for double-density
disks on the Atari 8-bit. The Atari's boot code uses the cassette
buffer which is only 128 bytes. In order to boot a double-density
disk, you have to have some 128 byte sectors which contain the core
code that allows the boot to continue once double-density sectors are
encountered. This code is loaded, takes control of the boot process
and instructs the drive to 'go double density' by manipulating the
drive's control block. I keyed in a program from some magazine I
called 'DriveZap', but I compiled the basic code so now I can't look
at it. If you want it though, looking at how the program

The control block contains the following info:

#tracks
#sectors@track
Density
#sides
Steprate
Select
Acia
Misc

For example, my present hard disk in my emulator reads:

40 tracks of 819 sectors each
Each sector has 256byts and the density is 8 with 2 sides
The steprate setting is 1
other settings are Select=1, ACIA=192, and Misc=17477

I've forgotten what the Acia and misc are, but IIRC, the step rate
setting is in milliseconds. Standard steprates for floppy disk drives
are 3 and 6ms?

Regards,

Jeff

Money isnt an issue, bandwidth or web hosting wise. I did it for fun. Now the fun has passed, it's more like a job, and thus it's time to call it quits. This time, I'm not going to turn around and change this. 31st Dec, and It'll be taken off my web host. (Thanks to James P. for hosting all the current filesand providing the URL www.atariworld.com, maybe James would like to continue using his server, and using his old URL for accessing the files? I'll email him soon about this.)

Bandwidth has never been an issue either. As I've always had generous donations of free webspace for all the files, except the actual web pages.

I'll be looking at providing a small space of Atari files on my webpage, for newly dumped or HTF files.

6139. just some ramblings about the progress in CD Data reader

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-11 13:05:26 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>
Message-ID: <aqo9un$rd5$1@nets3.rz.RWTH-Aachen.DE>
Source record: 26010

Howdy folks

I heard some of you DO follow the ongoing saga of the Cd Data reader development.

OK, for those interested:

I changed DATA last weekend so that the PathTable is saved in a string. Well, just the names of the directories that are in the pathtable. I need the names, starting sector and parent directory to be able to jump back a directory.

Up till now, only the names are stored. Since this now works I can continue with the starting sector and the parent directory. Storing the parent directory entries doesn't seem to be to hard, as only 2 bytes (IIRC, it might be only one) are used, but starting sectors are stored in FOUR bytes (actually 8, one CD's all sector numbers are stored low to high as well as high to low.). As soon as I know how big a number I can store in a string/string array (TB has those), I'll decide how I'm gonna store these. I'll test this myself.

I'm using the Atari EOL character (ATASCII code 155) to separate the entries in the pathtable string. I tested it with INSTR and TurboBASIC doesn't seem to have any problems finding them. I choose 155 because I needed something that probably doesn't appear in a filename (ISO 9660 was developed with M$, Apple and Unix in mind. What characters can be used where is clearly defined in ISO 9660. But many extensions have been made to ISO 9660. ISO 9660 declares how a data CD should look like by the way.) and has the added benefit that each directory entry starts on a new name without the need for an extra routine.

That's it for now. I'll update the version on my homepage as soon as I got a version that's ready to be used. For now you'll have to do with the old version.

CU Mathy van Nisselroy

PS I probably made an error translation Matthias' error trapping routine in his audio player utility. His utility does recognise a CD even if the software is started before a CD is loaded, mine don't. I have permission to use his code, Matthias only wrote an audio CD player utility and only to show what ASPI can do.
PPS I also have to figure out, why I'm using both DBUFR and DBUFR2. I probably had a reason, but I can't remember it.

I can understand a website is a lot of work:

http://groups.yahoo.com/group/atariswapnshop

http://groups.yahoo.com/group/classicemulators

http://groups.yahoo.com/group/rtdos

http://geocities.com/rtdos

plus about 18 more yahoo groups and a few other websites dedicated to
classic systems, such as the atari.

All related to my rtdos operating system project (feel free to join
any or all of them). You have the biggest collection of Atari eight
software I've seen (outside of Tom Hunt's). Honestly, I've tried to
use a webpage grabber to grab as much as I can off of your site for
archival purposes and for the rtdos operating system project (testing
purposes) as well as to back up my own personal collection of Atari
related stuff. No luck. The program keeps timing out or scrambles
the archives. Is there anyway I can convince you to email me the
collection or send it to me on a CD ? No, I am not doing this to
build a collection of Atari software on a CD and sell it or even put
it back up on the web, but for archival purposes and for the rtdos
operating system project (yes, even to back up my own personal
collection).

Can we work something out ? For more info on rtdos, see the links
above.

I should've read further in the group. :o)

anyways, what you want to do with my previous post / email is fine.
hopefully someone can put the stuff up on ftp. have you considered
asking Tom Hunt to put the files in spudster.org ? Maybe we should
get a petition / email campaign going to see if Tom Hunt would be
willing to do this ? :-\

You cannot simply hook up an ATARI formatted HD to a PC, because of the format of the HD.

You should use APE or sio2pc to transfer your atari files to your pc.

See, there are three our four issues to do with this:

The hard disks' interface is ST506/412 (often erroneously called "MFM"). The drive does not have it's own controller as a scsi or ide drive does.
So, you need a controller. Most often made by Xebec, Adaptec, Omti, Konan, You get the picture. It has to be the EXACT make and modle controller you used on the 8-bit because the low level formats differed from one make controller to another.

Then you need a scsi host adapter for the PC. and to hook your 8bit hdd setup to it.

You still won't be able to read the disk however because it is in an Atari-specific high-level format.

The other guy is right. Build yourself an SIO2PC and use the APE (Atari Peripheral Emulator software) to create some virtual atari disks and dump your drives to them. It's what I did.

Regards,

Jeff

In 96 or so I ran into a freeware game called "DualDuel". It was a Head-to-Head ML? clone of Batlezone but required TWO atari computers and the construction of a simple joystick port to joystick port communications cable.

Then the two people could shoot at each other instead of the computer.

Has anyone else seen this game? Does anyone HAVE this game?

Regards,

Jeff

it is written by Kolja Koischwitz and Christian Kruger. They written the freedom fileselector too. I am afraid that development of both apps was stoped.

Unfortunatelly the 800XL DeeJay doesnt work corectly with Falcon because it can use only RS232 port which has not connector but is present "inside" the Falcon And you must modify your Falcon if you want to use it. Second disadvantage is that this program use only DI disk images. But on the other hand I don't know better XL/XE disk drive emulator for Atari ST/TT/F.

Btw I have version 2.50 from 11. Dec 1994

Hi Aaron

I'm really sorry to hear that the site is closing. It's been invaluable to
me over the years mainly for replacing software which had suffered "bit rot"
or for letting me see a game before I made a bid for it at auction.

If you decided to create zip files and post them would you be able to make
an announcement in this group ?

I'm pretty sure I speak for all of us when I say thank you for the service
you have provided over the years.

Best Regards

Paul

We (me and STan) have tried to wrote some basic stuff in C under MiNT and
it seemed that it works. We was able to read 1st sektor from atr or image
from emu (Konrads emulator) but we had some troubles with timing. And due
to lack of free time we are write nothing from that time :-(

6163. Temp Fix - Holme's Web Site

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-12 04:03:10 UTC
From: "Patrick R. Cleburne" <j70141@kissmyass.com>
Message-ID: <24%z9.6898$tW4.843064@newsread1.prod.itd.earthlink.net>
Source record: 26034

Today, when I found I had an urgent need to the Debugger utility programs (I am learning Assembly Language for the 6502 processor) I found a message about Holme's Web Site being down or dead or something.

In response, I threw together everything I ever downloaded from the web site, including ROMS, Manuals, Games, and Utilities, and put them on my computer at home for anyone to download until this gets resolved.

The web site is: http://208.13.136.138/atari

This site has been up and running 24 hours (except when there are thunderstorms in the area) for the past year but is now scheduled to go down at the end of the week. If circumstances require it, I can stall the time that it goes down for a bit.

It does not look like an excellent web site, just a directory of stuff you can download.

btw, Holmes or anyone else... if you are seeing this. I have a dire need for the Debug+ program or anything that will help me debug Assembly Language programs that I have created. Thanks.

6164. Re: Temp Fix - Holme's Web Site

Source record: 26035

btw, two more notes.

For some reason my news server does not download all the messages on this newsgroup, so I may not receive any replies if they are posted on here. Then again, I might.

Also, I thought about using the FTP server on the website to allow people to download and/or upload any games that they want on the site, but decided against it. I have had an unusual number of hackers attempting access to the site lately. So, if you have any ideas... Well, just let me know if you have a game you want on the site. I am best reached at J70141@hotmail.com email address.

Great! I have one of these issues and always wanted to read the
others, but never could find them.

(Very weird about the publisher remembering 2 more issues.)

Absolutely the way to go Aaron. Just one or two large files vs. hundreds
of smaller ones since it appears that the server is at max load.

And yet, two more points... I'm sure I'll get it all this time..

The Megafiles are on there too, all 22 of them...

AND... last but not least.. please don't beat up my computer, it is glued together on a Generic Motherboard, with 450Mhz, connected through a permanent DSL connection, so don't go downloading a bunch of stuff all at the same time. Other than that, take it easy and download the stuff you need to download before it all goes down completely.

Have a few of these. When was the last Current Notes published? Also, when was the first "big" issue. I have issues from 1986, but somewhere they mention that circa 1984?, Current Notes was a small club newsletter.

I can get online to this site but, traffic is to heavy to get any of the items listed, YET. I would also like to get the zipfiles if they become available. Make the files available to all and there shouldn't be any mad dashes to make CD's and try to sell them because there wouldn't be a market for them.. Except for for cost of shipping and postage.

Perhaps you should study the source from the ATARI XL-ST LINK. This was wirtten in GFA basic (as far as I can remember) and is probably available on the Pooldisk. If you study this code you should be able to rewrite it, and enhance the code....

Succes!
Marius

p.s. I think APE for Windows is really fantastac, so why don't you take a nice ATARI LOGO and put it in a LAPTOP or a PC and run windows on your brandnew ATARI laptop/PC :-)

but XL-ST links has locked source - the program can be loaded only into
runtime not into editor. Maybe somebody has open version or know how to
bypass this restriction.

Peer to Peer filesharing might be a good solution here. If you
organise the files into some logically-structured archives then people
can continue to make them available via something like eDonkey after
your site stops hosting them.

So long as people continue to share what they download, server side
bandwidth won't be a problem.

Gav

6173. Re: just some ramblings about the progress in CD Data reader

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-12 11:53:43 UTC
From: Mathy van Nisselroy <mathy.van_nisselroy@post.rwth-aachen.de>

Source record: 26044

Howdy folks (are you only reading this? Don't you have any comments?)

Last night I managed to stuff the 'start of directory' numbers and the 'parent directory' numbers into arrays (strings without the '$'. Strings won't work, unless I turn them into ASCII value, but since these are numbers....)

With a huge pathtable I bump into something (computer lockes up). With a short pathtable it doesn't. This tells me I'm
running into something. Probable the ASPI manager itself. I tried to declare a string around it, but when I add more lines or Turbo BASIC code, these move. I noticed it moved at least have a kB up. GRRRRR.

I had hoped I could use ADR$ but since that moves around too, I had to poke each value individually. Maybe read will work, but you can not fill a string by poking to it's address. Unless maybe if you use the ADR$(..) right before you poke. If I could have used ADR$ I could have used DPOKE and DPEEK. Now I have to use one byte at a time. The starting sector needs 4 bytes the parent directory number needs 2.

Man my head starts hurting. But I'll get thrue.

My biggest problem is not how to get the data of the CD.
My biggest problem is how do let users select where they wanna go.

So here's what I've been thinking about. Remember I'ld prefer to use an TB only as much as possible. (I still have to find out how to use Ron Hamilton's routine without crashing the computer. Maybe when I understand this string handling stuff.)

I would like to use 2 extra lines per screen on the top and 2 or 3 extra on the bottom. The top would show the brand and type of CD ROM mech. If I ever find out how to, I'ld like to add a horizontal scroller to that. But that's for the future. The bottom would hold the menu options. These options wouldn't change much (except I guess when a CD is loaded or unloaded).

The middle (the screen we normally use) would show either the directory or the first part of the file (so you can check out what it looks like/what kinda data it contains). Since vertical scrolling would need machine language (if we don't want the screen to flicker), that's out. And scrolling would make it even harder to select a file/directory. So I guess I'm gonna check how many entries there are in the directory and either display all or just the first 20 or so. I'm not sure yet, how I want people to select a file/directory. Maybe I'll highlight the text and move the highlighted area up and down. maybe I can use joystick input as well as the arrow keys. I'm not sure yet. It would be nice to be able to use the

mouse, but that's just wishfull thinking.

That's it for today.

If somebody could tell me how to change the DLI so that I can set up the 2+3 extra lines and how to change their contents. And if he or she could tell me how I stay out of trouble (I've sometime typed in some code from magazines to find out that as soon as I modify the code, nothing seems to work anymore), that would be of great help. The rest of my problems I'll try to solve myself.

Howdy folks

For those of you who'ld like to see some pictures of the ABBUC JHV with
english text underneath them, please check out http://www.abbuc.de click on
'JHV' then on 'Bilder von Carsten Strotmann'.

I typed in the text. Most is English, some only have German text (but
you'll usually get the picture).
I've included as many names as possible. Quite a lot of these people are
either in the mailing list or in comp.sys.atari.8bit.

Looks like the others told you it is not supported anymore, but it works like a dream on my Hades 060. I have used it to load some nice programs. There is a converter than converts ATR and other images to DI images. You must run this on a PC though. I wrote a nice article on this great program and you can read it if you go to the Good Deal Games website. I also converted some Mega ATR images into Mega DI images and they are on the web also. This is a great program and allows to keep my old 8-bit disks safe. Soon I will out my favorite programs on a CD and use that.

I believe Kevin has the DDT, Dunnion Debugging Tool from the old Atari Program Exchange on his APX portion of his http://www.atariarchives.org/ site and there are .exe files of the old AsmEd cart available with its Debug online. There is also the disk version of Mac65 with its Bug65 (which received mixed reviews). Tom Hudson created HBug in Analog around '84; someone from TACE even re-ASMed it for $C000 for use on an XL with the translator. Check XLSearch.

It is interesting. I know very little about Hades. How the serial ports are made on Hades? Which serial port of Hades you can use?

> nice programs. There is a converter than converts ATR and other
> images to DI images. You must run this on a PC though. I wrote a

I think Jindroush has some image converter on his page. Maybe I can make it under MiNT

Well,
try APE or SIO2PC or Atari Filemanagement. These are floppy emulators,
so you can still connect your Atari with Floppy or harddisk to the PC.
Then transfer a) several files and convert them to small (S/E/D) images
or b) transfer the whole partiton and save it as a 16MB ATR image...
-Andreas.

Well,
it could be a problem because of bad DRAM. But I guess it is a
normal/standard problem of this type of RD: you replace 8 RAMs (4164?)
with 8 new RAMs (41256?). Now 64k are used as main RAM and 192k as
Ramdisk. Many programs do not know or recognize this and think the whole
upgrade is used as Ramdisk. You know with a 256k/192k RD the banks
83,87,8b,8f are used as main RAM and all others as RD - some programs
then tend to bankswitch the main RAM into the 4000-7FFF area, which is a
funny result... Why do these programs see 15 rambanks then (240k) and
not 16 (256k) ?!? well, thats pretty simply, they don`t see *one*
rambank (maybe the bank which is actually RAM under the OS ROM, maybe a
different bank)... -Andreas.

Well,
and another problem is that ACVT (an image converter for the PC!) can
convert ATR<=>XFD<=>DCM<=>SCP<=>DI - but the DI images do not work.
Meaning all other images are perfectly converted, but none of the DI
images created with ACVT are accepted by the XLDeejay. So, if you want a
better support of ACVT (and an update that creates DI images that are
fine), then send some sample DI images to the author of ACVT, Jindrich
Kubec. This might be one and the same DOS (MyDOS 4.50 for example) in
3-4 different formats (Single, Enhanced, double, DSDD) or a completely
empty image + an image that contains just one (or a few) byte(s)...

Well,
there is already Atari 800 for ST/STE/TT/Falcon computers. (As well as
Atari 800 for DOS, Windows, Linux/Unix, Amiga, Acorn, Apple Mac, various
PDA`s, etc. etc.) But a floppy emulator like SIO2PC or APE for the ST
family would be fine too... -Andreas.

Any of the main services would do. Once the files are out in the public domain so to speak, they should experience 'viral propogation'. All that would be required is a standard naming convention to make it easy for people to find and download them.

>>Christmas.
>
> Me to that year.

Likewise.

In Easter 1983 I replaced my ZX-81 with a shiny new Atari 400....they were
selling for £150 at Dixons at the time.

A few weeks later I bought a 410, followed by a 48K upgrade a couple of
months later. Then an "InHome" keyboard upgrade a month after that. For
Christmas I bought myself an 810.

If I had to do it all again I'd definitely make the same choice.

>....Sensible money was on the BBC micro like they had at school
>(£300 again) but i had less than £200 to spend....

Quite, the Beeb was a hacker's dream (in the TRUE sense of the word
"hacker", not what it has come to mean nowadays). But all that flexibility
cost!

>....was at the time a toss up between an Oric 48k or a Spectrum 48k
>(the commodore 64 hadn't really yet arrived in the shops round here).

Yes, "Micro C" and "Dixons" (the main computer shops here in B'Ham at the
time) were still selling the Vic-20 and were only taking pre-orders for the
C-64 which was "coming soon".

It did cross my mindy to wait and get the CBM, but having had a lot of
experience with the PET (my school physics teacher had one, he'd traded in
his Nascom II for it when Nascom folded) and some of the Vic-20 I rejected
the idea.

No matter how good the hardware/games, the system just was not to my taste.
There was no real operating system, like most machines of the day your
operating environment was BASIC. The disc drives were SLOW, no DOS, etc etc

OTOH It booted quickly and the kernal, though little more than a system
monitor, provided some neat functions.

Personally I didn't even consider the Speccy. My first home machine was one
of the very first ZX-80's, which was eventually followed by a ZX-81 in 1982.
After that I was damned if I was going to waste my money on another Sinclair

machine, they were cheap and clever designs, but IMHO the myriad design compromises made programming them and designing add-on hardware unnecesarrily complicated. :-(

Oric's were nice. I found the keyboard rather offputting though...?

> The Aquarius seemed out of place when it arrived, kinda like 2 years
>too late. It was competetive with Acorn Atoms, Vic 20's and the ZX-81's
>of 1981-82....

LOL, ISTR a magazine of the day (PCN?) making a similar comment about the machine being a couple of years too late.

It seemed rather a pointless exercise, like they'd taken a two year old design and slapped a Speccy style keyboard on it.

> Still wanted an Atari though, because of star raiders.

Heh, heh....one of the things which swayed me too. Probably the best version of Star Trek (on which it is so obviously based) on any home micro....

TTFN - Pete.

What was the old advertisement: Have you played your Atari today? :o)

Been awhile since you played your atari, huh? Been at a few years when
I last had my hands on a real atari. i had to buy one off of ebay just
to get the feel of one again (needed the 1050 disk drive that came
with it) but don't have room to hook up a full blown configuration. I
was playing around with turbo basic last week and was surprised at how
much i remembered. created a simple simon says game in under two
hours.

has anyone thought of creating a shell ext. for windows for the atari emulators (such as xformer or atari800win plus) that allows you to write click on the file and either load with or without basic enabled, load which OS, and which DOS (ados 2.5, mydos, sdos) ? that way you won't have to manually change the settings each time ? or right click and load using custom config a b or c ?

make sense ? or can it be done using the folder options in the control panel (open with) ?

Strings are dynamic in Basic; the string array table space is above your
Basic code in memory and will shift when code is edited. It should not move
during a 'RUN' unless forced read mode adds or deletes lines; another
exception would be to CLR and re-DIM variables.

You *CAN* poke data into the ADR of a string; but you cannot alter the
length so it will print properly without the conventional string handling
functions:

```
DIM MY$(3000)
MY$(3000)=" " <--conventional & sets length
FOR L=0 TO 2999
READ BYTE:POKE ADR(MY$)+L,BYTE
NEXT L
```

I often use CIO to read from a disk file directly into a string by Pokeing
ADR(MY$) into the IOCB buffer address bytes.

A DLI does not change the display size; you must create your own custom
display list with extra mode lines, etc. You will then need to Poke your
screen code data into that area of screen RAM because the E: device cannot
manage more than 24 lines.

Go carefully; 5 to 6 total lines is probably a bit much. Two on top and
maybe one on bottom should be fairly safe for most displays as IIRC there
are differences between PAL and NTSC. I think Arkanoids was done on PAL and
the bottom is cropped on my NTSC...

I did it this way: I'm using one program = one zip format, in each zip
are also desc.aff and run.aff.
desc.aff contains description of the software
run.aff contains emulator switches and other emu stuff

This way I just run it with 'r programname' commandline.

Minus is that this is just set of perl scripts which is unsuitable for
any distribution.

WinMX is excellent. Provides downloads from multiple users at the same time
and has "never" had spyware. Also, it is a little less known and less
likely to go down soon.

Atari800 is 'only' an emulator and therefore completely different from
what APE does. And it is really too slow to be usable on plain
ST/STE/TT/Falcon computers (a CT60 Falcon would be a different story).

BTW, for some time I have been working on optimising the assembler core
for 68030 and better but since the latest Atari800 versions are no more
compilable on my old MINT/GCC environment, and I did not succeed in
installing a working new one, and furthermore there seems to be no
interest in the Falcon version I quit working on it.

6201. My quest for a working image of Questron

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-13 11:31:45 UTC
From: Sean Whalen <na@na.com>
Message-ID: <Np2cnc7U6bq5pU-gXTWc3A@comcast.com>
Source record: 26172

I'm trying to find a copy of Questron that would work on an Atari Windows emulator (preferrably), like Atari800Win. I've found only one copy of Questron .ATR disks on the Net, and that was through the XL-It search engine. So far I've tried different versions of Atari800Win, the emulator always crashes when you start a character and after you insert disk 1. I've also tried Xformer 2000, I can get into the game but the status bar with HPs, food, etc. is jibberish and the keyboard movement controls are very awkward. These two seem to be the best Windows Atari emulators out.

I'd hate to use a DOS emulator like XL-It which hasn't been updated in years. If anyone has a working copy of Questron or knows an emulator it works on please post. I have an Apple version working, but I'd really like to play the Atari version since it's the one I owned. Thanks.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari (based in Silicon Valley,
California, USA) produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hi Aaron, your name sounds familiar. I think you posted to some of my posts I made years ago. I just visited Holmes and downloaded the Questron Alternate disk images, I'm amazed they seem to run in Atari800Win. Thanks!!! I just posted amother request for the game (I made one years ago) but I don't see it on the server yet, so please everyone ignore it. I'll have to download some others I couldn't get working before December 31st, just in case. :)

It's a shame the IDSA seems to want to destroy every years old game in exsistence, I wish there was a way to stand up against them. I thought technically backups for games were legal, but I'm not positive. Maybe if everyone puts on their site "For backup purposes only"? :) That probably wouldn't work though... :)

Hi Mathy-
A couple of things about your screen design: Five extra lines will probably cause problems -- if not for PAL systems, then surely for NTSC. Have you considered using the Text Box at the bottom of the screen? See location 703 (T) which is called BOTSCR. Pehaps by using that you could eliminate the added text lines completely or perhaps get it down to one added line to the display list?
Larry

> Basic code in memory and will shift when code is edited. It should not
move
> during a 'RUN' unless forced read mode adds or deletes lines; another
> exception would be to CLR and re-DIM variables.

re-DIM variables? Is that possible?
I only use CLR at the beginning (first line). I'm not sure what I did, but somehow, when I use ADR$(...) in the beginning of my utility, and then try the same again later. The values are not the same. And I do not use the forced read methode. It would be nice, but I haven't tried it yet. I haven't needed self modifiing code yet.

> You *CAN* poke data into the ADR of a string; but you cannot alter the

> I often use CIO to read from a disk file directly into a string by Pokeing
> ADR(MY$) into the IOCB buffer address bytes.

See my problems above. It bugged the hell out of me. But I've got a bigger problem at the moment. Yesterdays computer lock up WAS caused by two things wanting to use the same addresses. After I moved some arrays (well, these strings without $ behind them) everything worked fine. Then I move the dummystring I have that's supposed to protect the ASPI manager. At some point during or after that procedure, I saved the code. Then I checked the code and found an odd variable (wrong name and lower case too). To make a long story short, the latest version got mangled. So now I have to compare this mangled version with a previous version (I save fairly often, but don't use a different extender every time, so some improvements I made could be lost) and try to recreate the file. :-((

> A DLI does not change the display size; you must create your own custom
> display list with extra mode lines, etc. You will then need to Poke your
> screen code data into that area of screen RAM because the E: device cannot
> manage more than 24 lines.

I meant DL, not DLI. Sorry.
I read that you can add lines, set a vector to some memory, edit the text, than reset the vector and change the rest of the screen without the extra

lines being changed. Since the information on the extra lines wouldn't change much, I guess it wouldn't be to hard to handle.

> Go carefully; 5 to 6 total lines is probably a bit much. Two on top and
> maybe one on bottom should be fairly safe for most displays as IIRC there
> are differences between PAL and NTSC. I think Arkanoids was done on PAL
and
> the bottom is cropped on my NTSC...

5 is the max anyhow. 320 by 232 (192+5x8) is all the Atari can handle.

As far as i can remember the SAG (Stichting Atari Gebruikers (=The Atari Foundation) in the Netherlands) release their 'own' version of ST-XL link with a common GFA basic source listing. I can remember I edit somethings these days. and... another thing... there was a HAPPY computer magazine with the listing in it too... as far as I know this is the same magazine Turbo Basic was printed in....

But of all of this, I'm not sure (sorry)

That raises a lot of questions being :

Of the Atari800 emulator, really ?
Did you try any version of it on a 16bit Atari ?
Do you have a standard Falcon ? IIRC 'pole position' ran there at
about 5% of original speed. Programs with less sprites and/or less
changes on screen are faster since the video ram update in 256 color
mode needs a big part of the time. BTW, I think with CT2 it was 20%
and with AB40 25%.
Does the TT have a 256 color mode with 320x240 pixel or better and
if yes : is it interleaved or pixelpacked ?

I've been loving Atari800Win 3.0 Plus so far. I think it's run all the .ATR games I have except on NeverEnding Story, the emulator messes up on the 3rd part, on the .crk (I assume that's cracked) and normal versions. But I think it's the game, because I have a similar issue with the C64 version where the graphics mess up for the most part on the 3rd part but the game is still playable, it's a text/graphics game. And not a very good one I might add, lol. This emulator even runs Gemstone Warrior and I had problems with that game on every other version of Atari800Win except 2.5c I think it was.

I neglected to mention Synassembler having a debug monitor and its
availability on my page.

I think you are absolutely right. Last night I was able to fill the
ramdisk with text and copy it back to the screen. I 'think' everything is
okay. An important thing is to use a ramdisk driver that does supports the
Rambo upgrade. I used the RD.COM from Spartados 3.2d.
Thanks much,
Rick

6212. Flash Drive for Atari8

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-13 17:00:23 UTC
From: atari8man9@netscape.net
Message-ID: <4e391c6.0211130900.29d26b63@posting.google.com>
Source record: 26183

I just seen a Jump Drive 128MB USB Flash Drive and it's small is size 3"
It would be perfect if such a device could be installed in the XE/XL
128 megs would give you 8 - 16 meg partitions (Perfect!) for the 8bit.
Interface it threw the PBI port is what is needed for high speed.

Has anyone tried this?

-Atari8man-

6213. And here's a good tip for anyone playing Atari games on emulators

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-13 17:04:26 UTC
From: Sean Whalen <na@na.com>
Message-ID: <WcOcnb9HDe2FG0-gXTWcrg@comcast.com>
Source record: 26184

Make sure the file's not read only, and make sure it's set to Read/Write in the emulator, for example Atari800Win. A LOT of games mess up if they're set to Read only, Gemstone Warrior is one of them. :)

Never heard of a USB interface for the 8-bit per se.... USB is a little fast
for an Atari - you would need some kind of external CPU with code. Just as
easy to use the flash cards in IDE mode.

Hi, Larry;

BOTSCR (703) only alters how the OS treats those last 4 lines of a text screen; it does not create any extra space on the display, but I totally agree that adding 5 mode zero lines is too many...

CLR does not remove any variables; it just zeros all values and frees RAM
allocated to strings and arrays. You could conceivably use some string space
for one purpose and then CLR it and DIM an array for something else when RAM
is limited. The caveat is structure to preserve necessary values with
Poke/Peek and subroutines you could call again to define constants.

> Yesterdays computer lock up WAS caused by two things
> wanting to use the same addresses. After I moved some arrays (well, these

> use a different extender every time, so some improvements I made could be
> lost) and try to recreate the file. :-((

That is a strange symptom... Memory conflicts in high RAM around the screen,
ASPI and strings should not damage a variable name unless you were
relocating string offsets. The lowest in RAM just above LOMEM is the
Variable Name Table, followed above that by the Variable Value Table. Above
those are all the statements in the Basic program and then the String Array
space and the Stack area for Gosubs and For-Next loops. There is a large gap
between variable names and any RAM you should ne altering. May need to
```

rethink where ASPI is *and* how it is protected with that dummy string.

> I meant DL, not DLI. Sorry.
> I read that you can add lines, set a vector to some memory, edit the text,
> than reset the vector and change the rest of the screen without the extra
> lines being changed. Since the information on the extra lines wouldn't
> change much, I guess it wouldn't be to hard to handle.

Yep, after creating your DL, you can bump down the screen address by 40
bytes per line, POS.0,0 and print to line zero and then bump it up to
encompass those bottom lines and print to line 23 if you are cautious with
the cursor to prevent scrolling.

> 5 is the max anyhow. 320 by 232 (192+5x8) is all the Atari can handle.

I think Patrick may be talking about Debug+ from
ANALOG magazine. I forget by who(m). It is in
issue #39, Feb. 86. So if this is it, you can find it
in the spuster.org archive under magazines/analog/
files 86_02.arc. There's a text file explaining it
(I guess) in the text files, misc. Or maybe it is
on cyberroach site of ANALOGs.
Looked up author: Brian Shappel.
It is a neat debugger. It loads $A100-C0FF and screen
$BE00-$C0FF, so your code can't be there, and you
can't use it with a cart plugged in, unless you turn
the cart off. I used it sometimes. The neat thing is
you can set BREAK points, to stop program execution.
I think someone may have re-located it to other place
version.
Is this what you're looking for?

Hi Ron-

> BOTSCR (703) only alters how the OS treats those last 4 lines of a text screen; it does not create any extra space on the display <

Yep, but sometimes what is actually needed in a display is a space that doesn't scroll away as data is written to the main screen.

Hi,

Everywhere I come people are happy to see if someone still supports 8-bit by selling software/hardware or even repair.

There aren't that many active people anymore where you can get replacements or even new hardware for the 8-bit.

When you don't want to read the news don't, but give Ben a break here. He is just one of those people that's still around in the Atari scene where so many already left....

At first, I had something like this:
```
100 DIM LOCDIR(1000), LOCPDIR(500)
110 DIM DUMMY1$(100), ASPI$(2000), DUMMY2$(1)
```

All numbers are chosen at random here, in the real utility they are
different.
DUMMY1$ is to position ASPI$ in the right position, it will later be trimmed
to size or killed.
ASPI$ is placed over the ASPI manager.
DUMMY2$ is used so that I can see where the end of ASPI$ is located. (I use
ADR(..) for this) So that I know that the end of the ASPI manager is save
too.

The problem was, that, with lines of TB code filling up memory, DUMMY1$,
ASPI$ and DUMMY2$ had moved away from the ASPI manager. So I changed line
110 to 100 and 100 to 110.

That's what must have caused the problem. I repaired the file yesterday and
it was clearly visible at the variable name tabel had been damaged. Lines
of code looked simular to what they originaly were with the exception that
variable names had changed. I recognised the variable and stringnames, but
they appeared in the wrong place. Like this:

(example code, not real code)

```
A=A+1
B=C+D+2
IF C=27 exec menu
```

turns to

```
z=z+1
score=A+B+2
IF A=27 exec main

No harm in asking, but a very good alternative might be the excess of
PC type eprom burners on ebay. At a very much less price than a new
or even used Atari based Super E-Burner.

fast
> for an Atari - you would need some kind of external CPU with code. Just as
> easy to use the flash cards in IDE mode.

I know of atleast two prototypes that have USB. One is version 4.0 of the SIO2IDE interface (there are pictures of the schematic and PCB on Marek's site at http://www.atari.cuprum.com.pl/, click on SIO2IDE then have a look at wersja 4.0). Seems like Marek is still working on the software for 3.2 at the moment, as version (wersja) 3.2e is already on the site. The other one is by a Dutch hardware guru. He has a PCB that will fit into a cartridge and has TWO USB ports.

Howdy folks

Yesterday evening I was able to recover the lastest version of my CD Data reader utility. The proces was made easier by the fact that I have my 1MB XEGS ready to power up at any time. Enabling me to check the damaged file and compare it with the previous version. So on we go.

6232. Re: Network game "DualDuel"

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-14 19:44:12 UTC
From: Andreas Magenheimer <magea000@students.uni-mainz.de>
Message-ID: <3DD3FD0C.9EE0C128@students.uni-mainz.de>
Source record: 25953

Well,
please setup your Atari and at least tell me if the game runs a) with Gamelink-1 (jyostick-ports) or b) with Gamelink-II (SIO-port) interface or c) with something totally different. If you don`t know: Dataque developed the Gamelink interface 1, which ran via the joystick ports. thus you were limited to 2 Atari computers. There were 2 games available for Gamelink 1: Tic Tac Two and Modem Battleship (patched for GL-1 support!). Maybe this is game number 3 for the GL-1. The Gamelink-2 was developped several years later, it worked via the SIO port - and you could connect up to 8 atari computers together (meaning 1-16 players via network!). in the beginning, there was only Maze of Agdagon, developed by Dataque and the Agda Group. Some years later Bewesoft/jiri Bernasek read something about this GL-2 device and soon developed another game, as well as schematics for a) easy 2 computer connection and b) 2-8 computer connection. The new game was called multi-dash. About half a year ago jiri wrote 2 more games for the GL-2 device: multi-race and multi worms. so finally, GL-1 has merely 2 games available (see above!), whereas GL-2 has already 4 games available...

Please tell me with which device you played Dual Duel. Via modem? Via GL-1? Via GL-2? or something else...? Hey if you - or somebody out there - has a copy of this game, please be so kind and e-mail me, so I can add it to my collection of networking atari 8bit games...
-Andreas.

P.S.: Anyone interested in those networking modem-, GL-1 or GL-2 games, just write me an e-mail and I will send you these as zipped ATR images...

None that I know of. A Polish, Czech, or German PD version, maybe?

> Also, is the 7800 better than the 5200 and the 8-bit?

Sprite capability is much better: 128, four shades (colors?) each, vs.
four sprites+missiles on the 5200/8-bit. Sound, however, is much poorer
and is identical to that on the 2600.

Are there any examples, playable via emulator, of synthesised speech on the Atari XL?

Did any 8 bit XL games feature synthesised speech (like many C64 games)? Did any 400/800 games feature synthesised speech?

Gareth.

That'd be nice! All we have for now is Galaxian and some of the
old games like, what was it? "AE"?

<snip>

I didn't like Galaga on the 7800 much. I ended up giving up the 7800
I had after a short while. (Maybe I shouldn't have, but oh well :^))

Galaga on the NES was pretty good, though. ;^)

There was S.A.M. (Software Automated Mouth) for the Atari (as well as C=64)

I know of some games that use digitized audio/voice.
Not any off-hand that use synthesized. I know there are, I just don't
know them off-hand. (Most probably utilized SAM)

Check Ken Siders' page; he has a good W95 utility to manage images. It has
create, format, view, import, export, several more. It does not handle
enhanced 1050 density or Sparta types, but does fine on most things. For
some reason it loses sectors 719-20 when creating a DD image...

Try 'Kennedy Aproach', I believe it has built in digital sound FX. Can't think of any others, although I read somewhere that was the whole reason for Tramiel including a voice in the 1450XLD's. From what I understand is that he believed the Atari computers were basically game machines that could be tinkered with. I'm sure there are some other games out there. Another would be the intro to 'Ghostbusters' by Activision.

Andreas,

I had (and played) DualDuel. It predated GameLink I by several years. I don't remember much about the game, only that you had to find another file that explained how to build a cable. Again, I don't think it was GL1 compatible, but it was connected using joystick cables. Like the other guy who's responding, I have it on a 5.25" disk somewhere...

I was one of the 3 guys that developed Maze of Agdagon and the GameLink II protocol. I'm glad somebody finally got around to writing additional games using the concept.

Your eight-bit friend,
Jeff Potter

> Those are both digitized, rather than synthesized.

No, that's not quite true. Both speach engines are the same: They build up
the speach from basic phonems rather than full samples (the latter has been
the case for "Nadral", for example) and use a quite intelligent logic to
generate consonants on very small data sets. Phonem synthesis is then done by
the aim of the pokey timer interrupts within the interrupt routines itself.
Of course, the selection of the phonems have been optimized for the purpose
of the game for easy word build-up, unlike S.A.M. which can do this all
itself (and can even translate written text into phonems with the help of
the "reciter").

So long,
Thomas

Howdy folks

> Umm... I think 'Ghostbusters' only said "GHOST-BUSTERS!", to the tune of
> the music. That was sampled, not synthesized.

I'm going thrue my old Atari User magazines (to find some old stuff) and in one of the letters/questions someone sent in, the question is raised if there is a voice synthesizer in the atari 8 bit computer. As an example the game E.T. is mentioned. So I guess E.T. has digital sound too.

BTW READIT by Tom Hunt will read any text and try to pronounce it. With english text this sound fairly OK, with Dutch or German text it sound horrible. But that is to be expected.

CU Mathy van Nisselroy

PS READIT is selfextrecting, so you need Sparta (or maybe BeWe DOS) for it. The extrected file should run on other DOSses to.

Funny enough, but that's not how it is replayed. The speach engine is really
smarter and the sound is not "just sampled".

So long,
Thomas

Best Electronics is the place to do business. No hard sell there! Unlike Ben who seems to come off a little harsh when selling his stuff. Spamming a news group like this one which has members who can use the Internet to find sites that sell Atari software/hardware pretty easy on their own is overkill on "Push Advertising", others call it Spamming too. If Ben wants to add his personal expertise and knowledge on subject matter that is shared within this news group, great. But, he should leave his marketing at the door. On another note "HOLMES RULES!!!!!!!" That site will be missed terribly when it is gone.

6277. *BLURB*

Source record: 25899

The first thing I have to say:
Everyone should stop talking about spam.

In Europa Atari stuff is vary hard to get. So I'm happy when I read about sellers in this NG. That is NEWS too you know!! When is it marketing? When not? I think the Atari 8bit is not very interesting for comercial purpouse at all... so If someone sells anything... atari8bit software/hardware He's ok to write about that in that newsgroup.

Secondly:
All folks writing angry thins about others: don't start any fights here. You should do that in private! If you don't want to read about Bravo Sierra... simply ignore it, and if you think Freddy was wrong to post the advert... just mail Freddy personal. (IMO Freddy made a right decision)

Thirdly:
We ALL should try to get the atari 8bit scene ALIVE as long as possible. Reading all those nerds, being mad about spam or not... pfff get lost and never return here. Everything what has something to do with atari 8bit belongs here... commercial or not.

So... that's what I wanted to say!

Bravo Sierra: Keep going!
Best Electronics: Keep going!
All others: Keep going!

And about commercialising: you ALL should register APE... it is definately great!!!!!!!!

That was a filename convention I used over at UMich.
They're text files (ASCII) describing particular files.

For example:

somegame.arc
somegame.blurb

"somegame.blurb" might containg something like:

Some Game. A game of some sort. (c) 19xx Joe Random Programmer
Requires TurboBASIC XL.

I named them ".blurb" instead of ".txt", since there were many
text documents at UMich. For example:

basic_commands.txt
basic_commands.blurb

"basic_commands.blurb" might contain something like:

The file "basic_commands.txt" is a gigantic text file describing
all of Atari BASIC's commands, how to use them and why to use them.

I'm sorry, but I have trouble believing this!

Logically, it makes sense to use a sample rather than try to reproduce
using synthesis.

Why bother having ALL that code in the program, just to say the
phrase "Ghost! Bust-ers!!!", for example? It doesn't need to be
"smart" to do that. I can't imaging it being smart enough on a stock
Atari XL to be able to reproduce it nearly as accurately as it could be
sampled!

Sure, samples are big, but if you're only using one, the amount of
programming work (and, in this case, overhead in space for the synthesis
code, since it's only used for this specific purpose: one sample) makes
no sense.

Hi,

I guess there's a half-way house in there somewhere... compression?

I messed around with converting the C64 'Impossible Mission' phrases
onto the Atari from the SID file. Oddly enough, the 26K of file has about
0.5K of code. The rest of the file is 7 phrases, each gets decompressed
into upto 20K or RAM and then re-played via SIDPlay's sample replay
routines. I haven't checked but would guess that this is not how the
original game held the samples.

The results of replaying these through Atari800Win+ is a little
disappointing.
More distorted than the C64 playback and I'm not sure how accurate the
POKEY timer emulation is but the samples play back at an odd rate.
I can forward the code to someone who better understand this and
wants to finish it up ;-)

Regards,

Mark

This reminds me of a game I picked up on a bbs back in the late 80's. It was one of those 2 player artillery
duel games. The twist was it could be played by modem. Unforunatley I never got anyone to try it with.

Another game that would be fun via modem or other local connection would be similar to that world conquest
game for the ST (was shareware, now freeware I believe). Was similar to the commercial release from interstel
(empire?). Since that one ran on a barebones xt clone (albeit at a dead crawl compared to an atari) it should
be acheivable on the 8bit.

Sounds like the idiot who was posting crap via that anonymous remailer a

Those bravo sierra bashers should have their 8bits replaced with cheap XT
clones from the local thrift store.

I believe there was a prototype of BERZERK arcade game for the 8bit that used speach synthesis. I dont have it myself but I remember hearing about it in my bbs days after someone "acquired" a bootleg copy and had uploaded it to some pirate boards that still ran in those days. I'm not sure how to get a legit (if there is such a thing) copy of that game now.

I pretty much agree with you.

I just got 2 orders from Ben. He does a wonderful job at what
he does. It's like the year 2002, it's not that hard to set a filter so
why the constant hoopla. Hmm..

Unfortunately we are stuck with this anonymous guy with an interest in joining male couples.

There are ofcourse several opinions about the postings of Ben. I personally would like to see these postings in a mailing list which his regular customers can join. However, I can imagine he needs new customers and some of his potential is probably here in this group. Also, I have to admit that the regular postings remind me of placing another order.

Now the other side of the coin; those 'bashers'. I've been seriously thinking about making a B.S. FAQ so that people who are with or against B.S. know how to behave in this group. The B. haters can read the alternative Queen lyrics 'We will spam you!' to calm down and the B. lovers can sing along with Pink Floyd's alternative 'Leave Ben Smith alone!'.

Ok, now back to Atari issues. PLEASE!

Freddy.

The SIO2IDE is an external CPU with code. This is basically the same as
using SIO2PC and the USB port on the PC....

Maybe the cartridge is on the Atari's buss.... that would be impressive.

http://www.homecomputer.de/pages/f_apple.html

If you follow the above link, scroll to the right with the pictures of the Apple compatibles at the bottom of the page and check the "Microdigital TK 2000". I wonder if this thing was for real. It is listed as an Apple II plus clone and is housed in what appears to be an Atari 1200XL case. I don't own a 1200XL, so those that are more familiar with the machine may be able to pick out differences, aside from the function keys and decals that is.

A case of somebody using the same case manufacturer for their machine? ;)

Bill

Huge collection of AIM, Atari Classics, Atari Explorer, Antic and Analog magazines.

I have 'almost' every issue of each, but I havent done a thorough inventory in a while.

Most are in excellent condition for their age.

In total, three full boxes of magazines (each box is from a full container of 8x11 paper)

Hey Freddy,

Besides the crap this guy is writing about you, I must agree with the fact, you are really a GREAT MAN in atari 8bit history. If you read between the sentences he must be a big fan of you, and I am too.

I love to show other folks your great demos. My absolutely favorite is that little colour demo, and the third part of the great lakes demo (HTT is the main star in the atari 8bit scene)

Btw. Can you explain to me, how to make softy sprites, as solorsystems did in great lakes demo?

Thanks a lot.
Marius

Ehmm are you interested in sellers of nice equipment too?

The "Black Box" for instance (and the floppy board) are still available
(NEW!)

A few days I ordered a new Black Box... (As i told at JHV I'm scared to
death my black box will be defect one day....)

If this is a joke, it's a pretty good one. The keyboard is really different.
If someone just made this 'picture' with photo-editting it's a great one!

But... perhaps it's true, but indeed... a 6502 clone with a Z80 cpu? Perhaps
an emulator :-)

Btw. I printed the picture and it belongs above my bed for a night... (I'd
like to know what's Hester's thinking of that ;-)))))

Greetz.

I use the Modem 1 port. The Hades also has a Modem 2 port, but I
do not use it anymore since I have an EtherNet connection.

Yes, that is one I use, but it would nice to have an Atari TOS
program that would do the conversion. He said someone else would
have to do it.

6319. Re: "Synthesised" speech on XL?

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-16 17:35:54 UTC
From: atoz <atoz@home.net>
Message-ID: <_lvB9.4225$aB1.877@nwrddc02.gnilink.net>
Source record: 25940

Tramiels had nothing to do with the 1450XLD other than kill it. All the work on the
1400XL and 1450XLD were done during Warner years.

There was also another product that for the 8bit that appeared for the 400/800 that
was called Voicebox. It was a voice (or speech) synthesizer that was based on
the Votrax SC01 chip (same chip found in the 1400XL and 1450XL). Device didn't
work well on 1200XL's due to the resistor that limited current on the 5V line on the SIO
port.

The 1450XLD TONG motherboard computers used a Votrax SC02 equivalent chip,
the SSI 263 made by Silicon Systems Inc. This was considered a third generation
voice synthesizer chip. Byte Magazine had a article where one of these chips was interfaced
to a Apple II computer. The SSI 263 had interesting effects to enable to chip to
simulate singing and other types of inflections.

Other projects for the 8bit included the interfacing of the Texas Instruments SPO256 chip
through the joystick port to do phoneme based speech synthesizing. Radio Shack was selling
those chips for a while. And there was even a companion chip that did the text to speech
conversion.

One other speech chip that existed in the 8bit days was made by National Semiconductor.
It was their Digitalker series. I think they used a special method of compressed speech
information stored on seperate chips to do the speech. You would use various chips that
contained the speech you need for the specific application. It was mainly designed for use
in devices that needed very clear human speech but didn't require a huge vocabulary of words.
Most of the words were in a female voice.

Why do you want this?
My Laptop P90 (used as "mobile ATARI") is running ATARI800Win without
DirectX installed. I just copied every .DLL, the emulators errormessage
asked for, into the Windows95-systemfolder until the emulator runs.

Marius,

Thanks for the kind words.

BTW the LCD was not my work. I made 'The Little Demo' which was released around the same time. Another one is 'Watch Diz' where Prizm did the graphics. Those good old days.... :)

I can give you the source code of soft sprites I once did. That routine is a little more general since it can move sprites over graphics. Most fast soft sprites move over a clear back-ground.

Freddy.

Hmmm okay... but the Little Colour Demo carries the name HTT and in my
memory HTT=FRANKENSTEIN=FREDDY=YOU!!

But ok... I'd like to have that source... is that in Mac/65 format? Or in
(at)ascii?

Thanks!
Marius

The last CN was Volume 16 Number 5, 1996.

My earliest issue is v5n6 1985, which I guess is in the "big" era.

HTT was: SolarSystems, The Extirminator, The DDT-Crew (one person) and
myself.

Eh, the source is in Atmas II or PC65 (ascii).

Freddy.

6328. MyIDE tool 1.1b ready to test

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-16 22:19:24 UTC
From: Marius Diepenhorst <grover25@zonnet.nl>
Message-ID: <ar6g63$h4p$1@reader10.wxs.nl>
Source record: 25849

Hi!

Tonight I finished the first official beta release of MyIDE tool 1.1

It is a compiled version of my Basic release (debugged as far as i can see now)

With this software you can use 28 partitions of 16mb each in stead of the limitation of 8 * 16mb. You can switch partitions, you can de-select them and use a name for each partition.

The software runs with Bewedos, Spartados, Mydos... other dosses I didn't test.

With this version, you cannot use the Image (diskette emulation) of MyIDE.... In next version i'll make this option too. Btw. I think it's still interesting to use my software in stead of the image emulation... but ok....

Very interesting is the switch ability... now you can make ready a boot partition on d2: and if everything it's on it, you can switch it to d1: Now you don't need to unplug cables etc.

Sorry for the slow version, but due to lack of time I debugged the basic version and compiled it.

In next versions I'll work on:
a) full assembler source (almost finished yet)
b) partition list can be saved on cylinder 0 of HD (now you have to use an external partlist.dat file)
c) more partitions (now up to 28)

If you are interested... mail me. There is no documentation (yet)... you get an .atr file with mytool.com and partlist.dat

Bye for now.
Marius

Source record: 25850

I forgot to say... the compiled version is a .com file ofcourse. So you
don't need basic anymore to run this (version 1.0b was basic)

It'd be nice if you'd provide a QIF index file so that it can be
indexed by XL Search :)

http://www.newbreedsoftware.com/xlsearch/

For info on QIF file format (and a Perl script to make a bare-bones one for
you), see:

http://www.newbreedsoftware.com/xlsearch/help/

(The "About QIF Files" section near the end)

Oops, sorry..Did mean to post an announce re it but I'm just back from
Hols in Florida and have not had the time.

There's lots of nice stuff in 3.1 that people will enjoy, do have a
good look at the help file for details.

What was the problem with Master of the Lamps?

6347. Installing a 2.5 HDD inside a 1200XL

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-17 20:30:37 UTC
From: Richard Heldmann <rheldmann@rcn.com>
Message-ID: <ar8u9d$k5d$1@bob.news.rcn.net>
Source record: 25868

I am thinking of installing a 2.5 HDD inside my 1200XL. The Hitachi drive
is marked .5Amps 5 volts DC. Where is the best place to get 5 volts inside
the 1200XL? Or is this a very bad idea and do I have to go external? Btw,
I have a Rambo XL already installed.
Thanks,
Rick

6348. Name that Music!

Newsgroup: comp.sys.atari.8bit

Folks!

I've been listening to an Atari tune for weeks. It's from the CSS title of the game FEUD. Where is that tune originally from? From the sound I guess it's been written by David Whittaker.

You can find this version of Feud over on Holmes' site, it's named Feud [alt].

6349. Troll's Tale

Evening again, Folks!

Does anyone know where I can find the ENGLISH (or maybe German version, if there is one) version of Sierra's "Troll's Tale"? I've been searching the net but only the Polish version pops up...

Frank

I've mailed Sean but if anyone else is wondering about the Master of
the lamps thing then just to let you know that it's a known issue.

ANTIC emulation is scanline-, not pixel-exact.

This causes display bugs in following programs:

Title Category
8 Players Demo demo
Bewesoftï¿½s Demo demo
Bitter Reality demo
Darkness Warrior picture
Demonic Laughter music collection
Extract graphics collection
GED graphics editor
Joyride demo
Mail Order Monsters game
Master of the Lamps game
Orneta '95 invitro demo
Our 5oft Unity Part demo
Power Graph graphics editor
Studio Dream demo
Sweet Illusion demo
Te.mod demo
The Break demo

6351. Re: Atari DOS 1.0 question

Newsgroup: comp.sys.atari.8bit
Date: 2002-11-18 01:21:38 UTC
From: "Roy G. Biv" <erasmus@6502.chip.old.folks.home>
Message-ID: <Pine.GSO.4.44.0211171947450.15235-100000@shell1>
Source record: 25872

On Thu, 31 Oct 2002 at 15:00:20 GMT, "Winston Smith" at a munged
address scribbled:
-> Wasn't the standard for DOS upped to DOS 2.5 ? I rarely remember
->using 2.0S all that much (I think DOS 2.5 was an "official", "good"
->DOS ??? ...as opposed to 1.0 and 3.0.... Was there ever a 4.0 on
->the drawing board ?)

I'm commenting on this issue from the perspective of (1) a user
of the actual hardware (not emulation), and (2) based on the real-
life experience of those of us who were involved during the heyday
of the Atari 8-bits, admittedly back in the 1980s, when everybody
used the "prototypes" (not emulation).

When the Atari 8-bits were actually popular (believe it or not),
the "standard" was ADOS 2.0. 1.0 was a primitive, early version,
which was quickly forgotten. And the immediate successor to 2.0 was
3.0, which failed largely because (1) everybody hated it, mainly
because it was incompatible; (2) nobody wanted to have to recopy
their entire disk collections; and (3) it really wasn't any better,
anyway. (Most people considered it to be worse.)

It might be pointed out (and surely was) that there were/are
other, third party DOSes that are "better" (more powerful, more
options, etc.) and which are still 2.0-compatible, so it made no
sense for the Atari Company to try to foist an incompatible 3.0
onto the user community. The protests forced the Atari Co. to
go back to the drawing boards, after which they came out with 2.5,
which is mostly 2.0-compatible.

In my view the key concept is "2.0-compatibility." Thus a more
precise name for the "standard," in my opinion, would be "2.0 or
compatible."

But as I say, that's the viewpoint from the olden days. If
today's users, most of whom are probably emulating, consider the
standard nowadays to be 2.5, then maybe it is. But even so, I
would still point out that a key reason for that would be that from
its beginning 2.5 was supposed to be 2.0-compatible.

As for 4.0, there was one put out by Antic (also called Q-Dos),
as I recall.

2.0 was a "good" DOS because it worked well; it was by far the
most widespread in actual use; and the most popular alternative,
third-party DOSes were mainly compatible with it. By the time
alternatives like Sparta began really catching on, most people

were switching to the 16-bits and "IBM" clones, and later on in the '90s, to emulation and <groan> Windoze. (Only kidding: I like Windoze!)

My favorite, which I still use, is DOS-XL. It is, naturally, completely 2.0-compatible.

Yep, Paul sent me the bug list plus a few images of Master of the Lamps for C64 as well. :) And I just got Mail Order Monsters for C64, I had it for Atari but didn't really get to fool with it much. I loved my Atari computer, but mostly because of the games. Emulation isn't perfect, and I'm not going to be picky about which one I use. I don't really have the space or money to keep up with old computers and consoles anymore, so emulation's really cool for me. :) My thanks to people like Paul who keep old memories alive.
